UML2.0 – 13 Tipuri de Diagrame

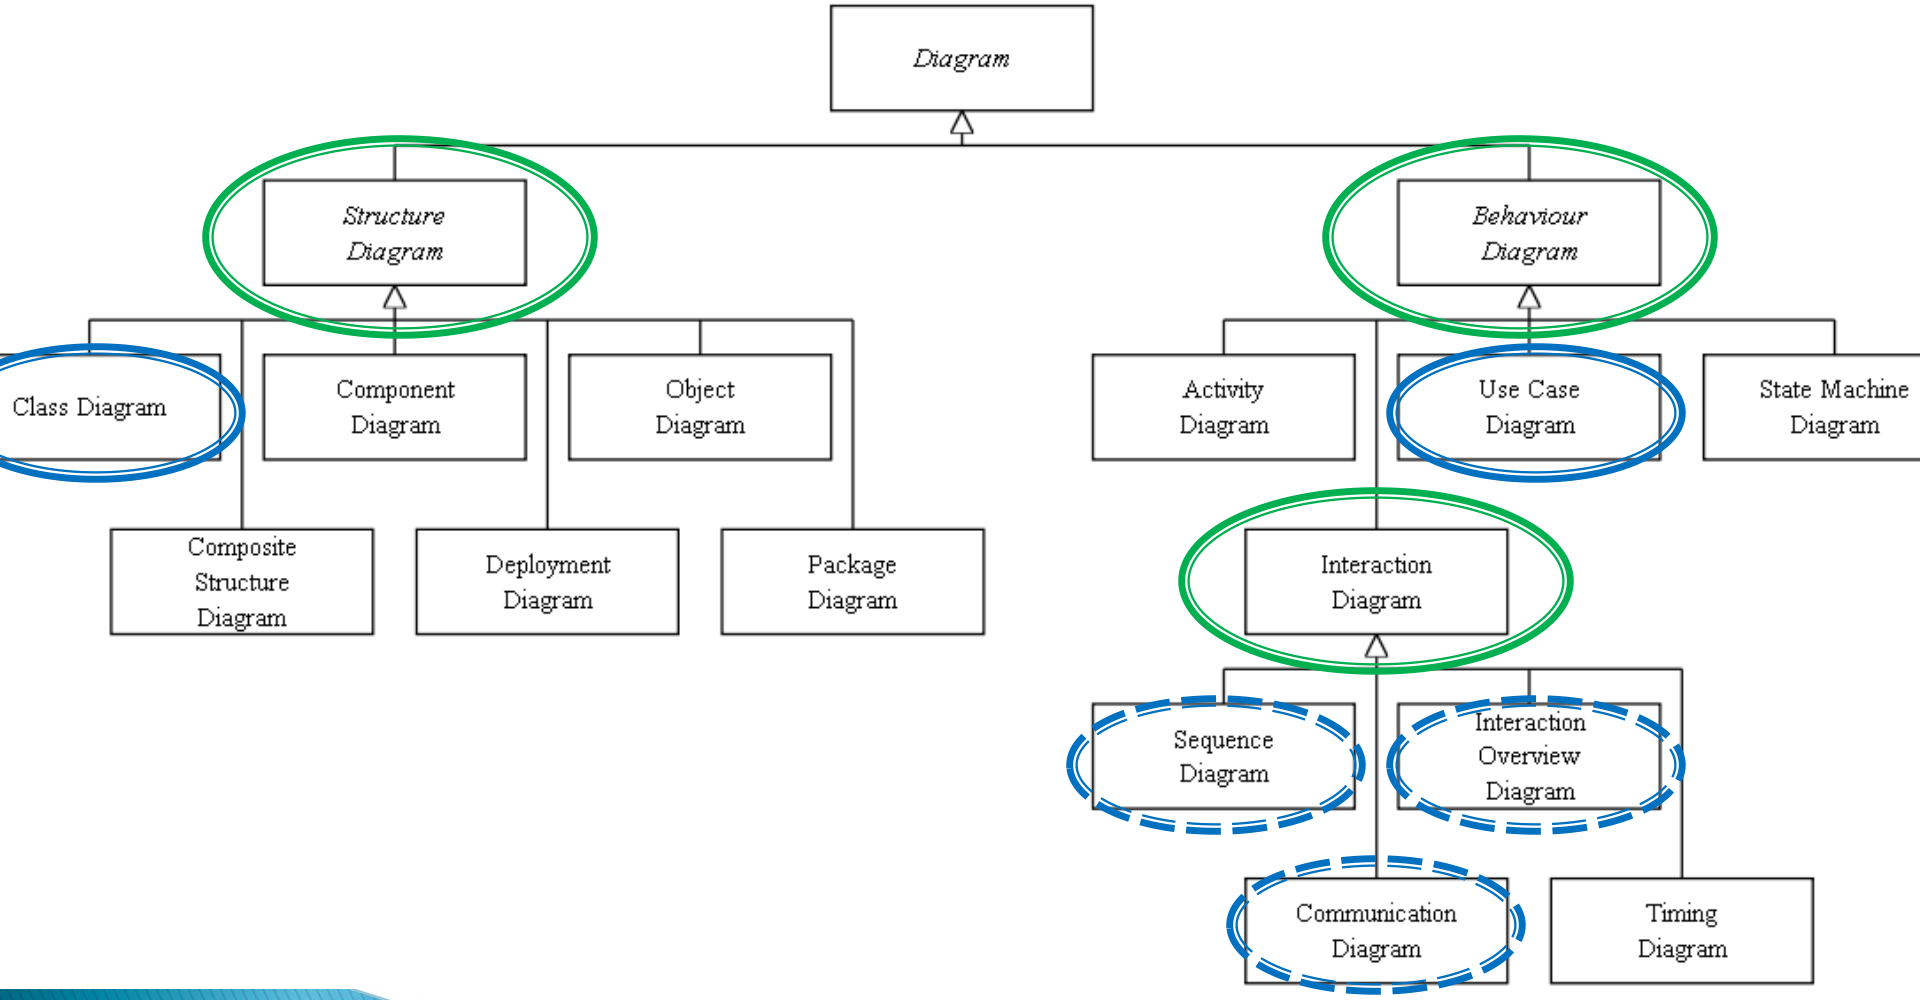

Diagrama de Secvenţă

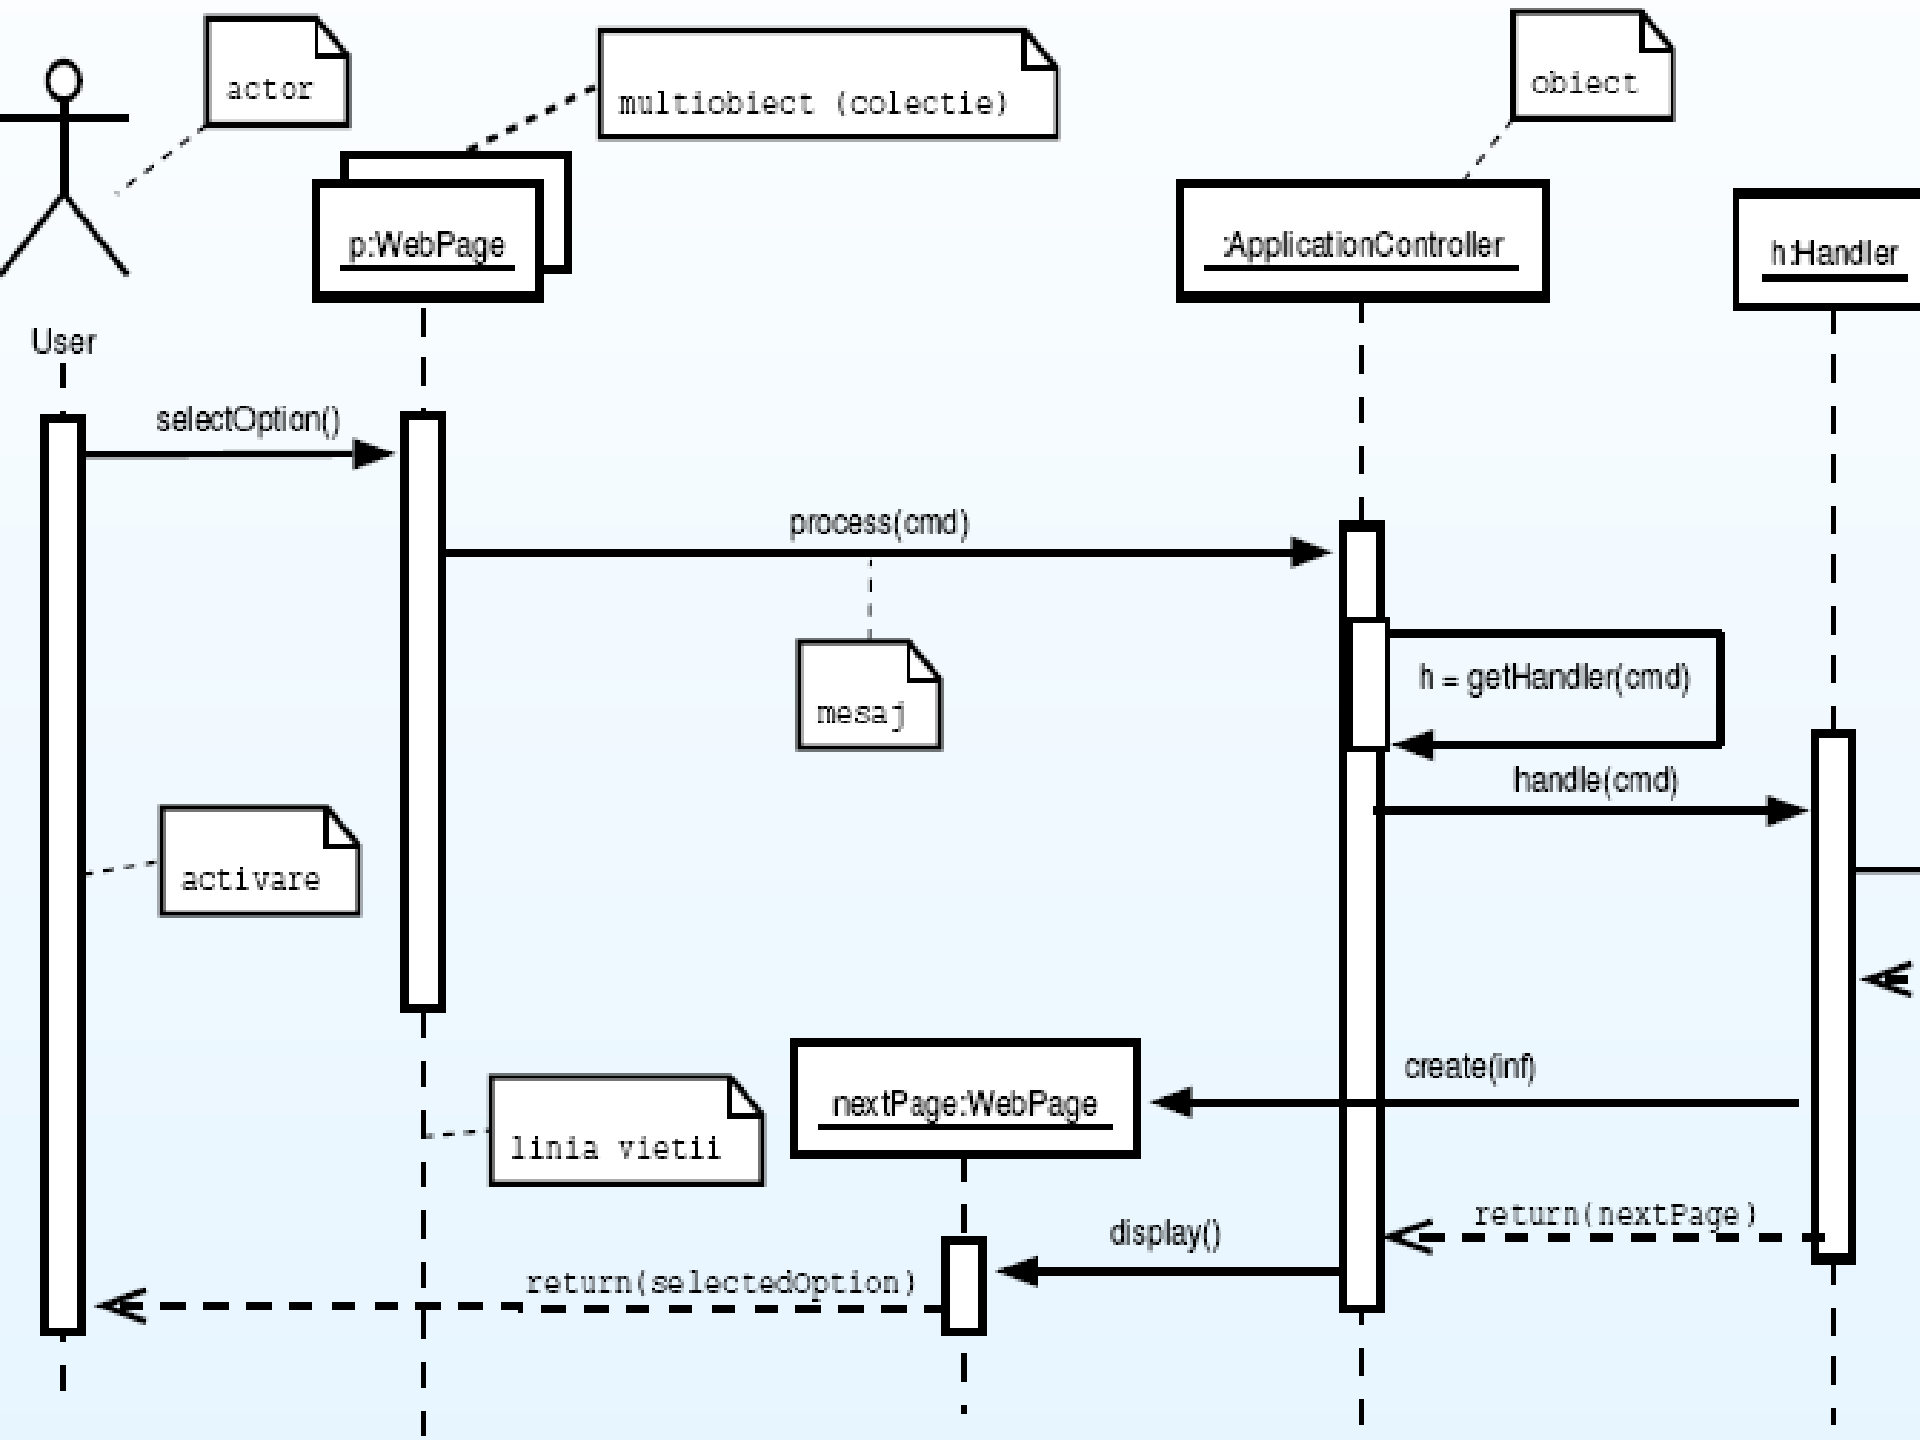
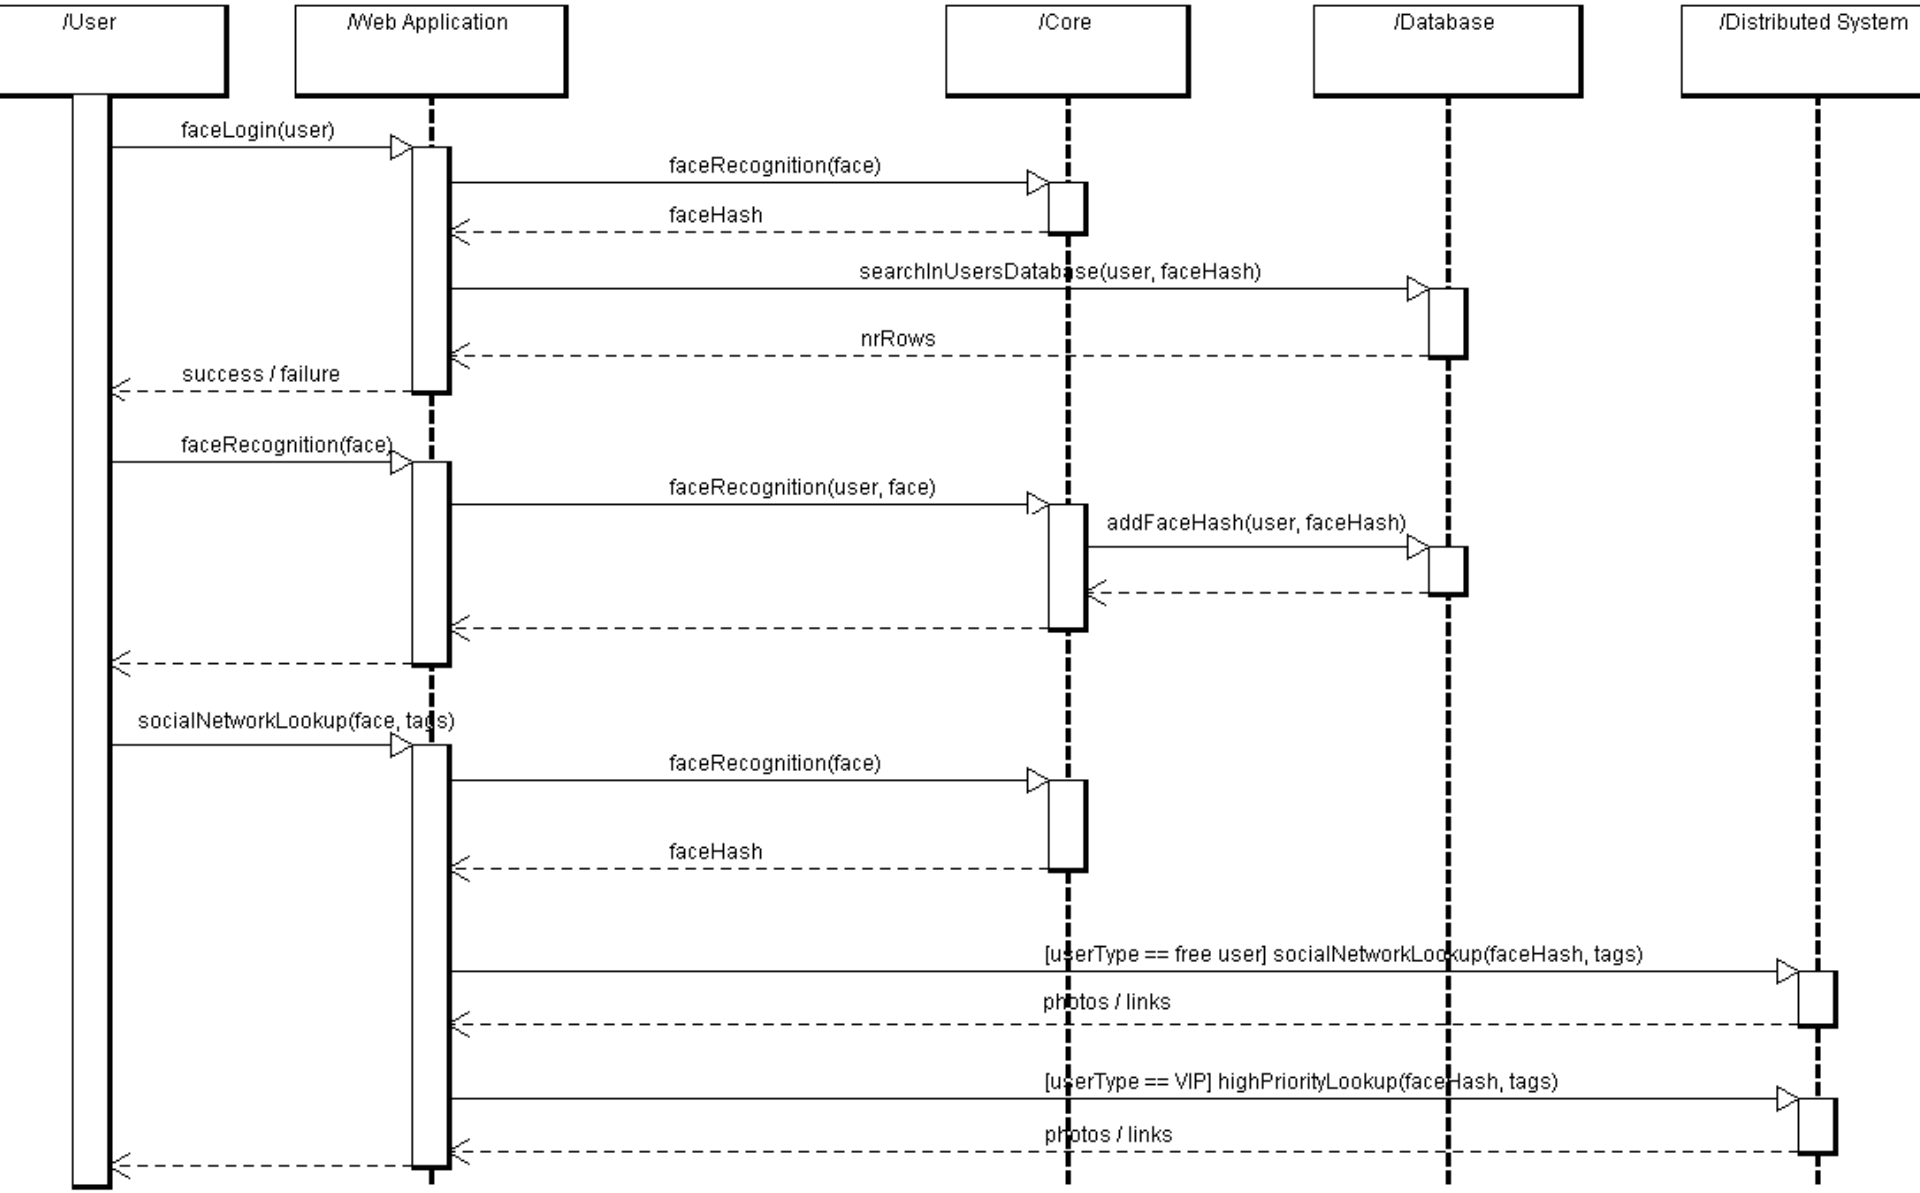
- **Diagrama de secvenţă** curprinde secvenţa acţiunilor care au loc în sistem, invocarea metodelor fiecărui obiect ca şi ordinea în timp în care aceste invocări au loc

- O diagramă de secvenţă este bidimensională
  - Pe axa verticală se prezintă viaţa obiectului
    - linia vieţii obiectelor (grafic: linie punctată)
    - perioada de activare în care un obiect preia controlul execuţiei (grafic: dreptunghi pe linia vieţii)
  - Pe axa orizontală se arată secvenţa creării sau invocărilor
    - mesaje ordonate în timp (grafic: săgeţi)



actor
multiobiect (colectie)
obiect
p:WebPage
:ApplicationController
h:Handler
User
selectOption()
process(cmd)
mesaj
h = getHandler(cmd)
handle(cmd)
activare
create(inf)
nextPage:WebPage
linia vietii
return(nextPage)
display()
return(selectedOption)

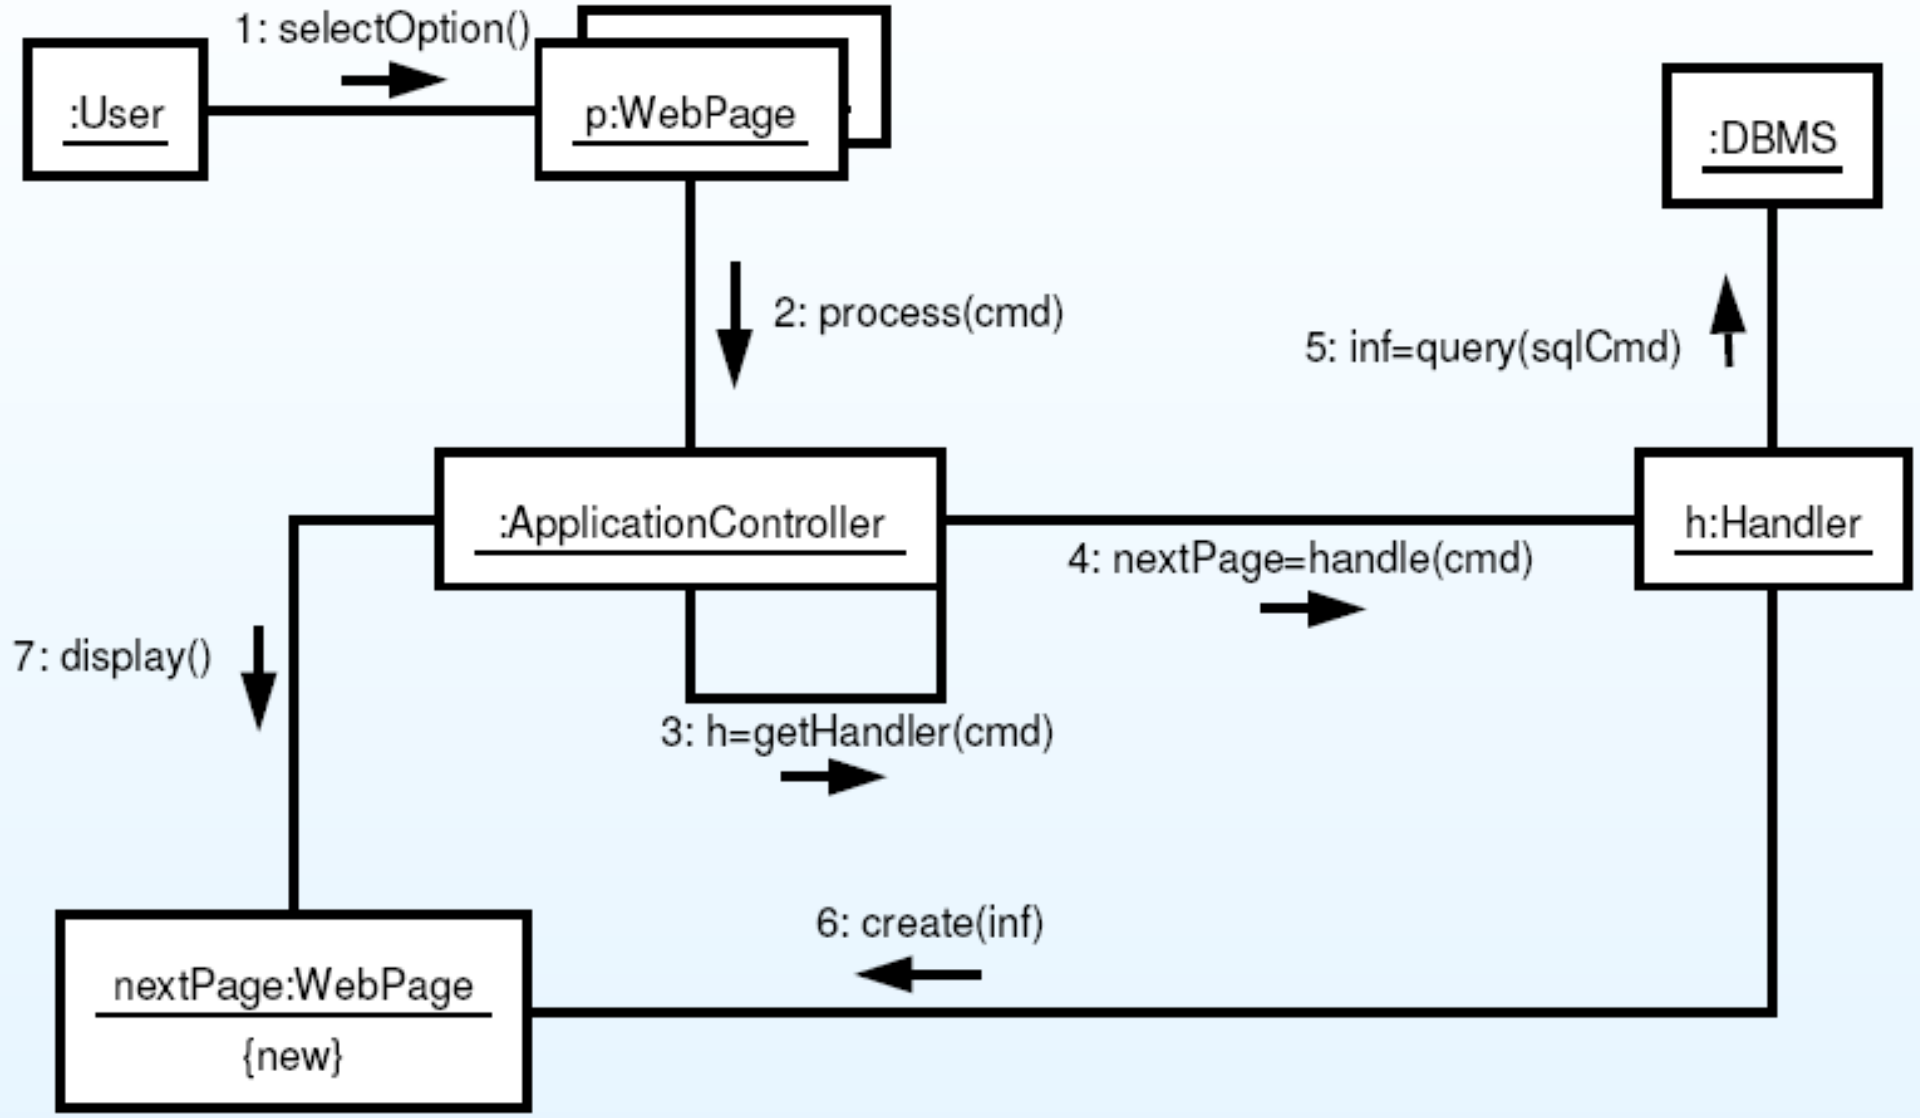


/User
/Web Application
/Core
/Database
/Distributed System
faceLogin(user)
faceRecognition(face)
faceHash
searchInUsersDatabase(user, faceHash)
nrRows
success / failure
faceRecognition(face)
faceRecognition(user, face)
addFaceHash(user, faceHash)
socialNetworkLookup(face, tags)
faceRecognition(face)
faceHash
[userType == free user] socialNetworkLookup(faceHash, tags)
photos / links
[userType == VIP] highPriorityLookup(faceHash, tags)
photos / links

Diagramă de Colaborare

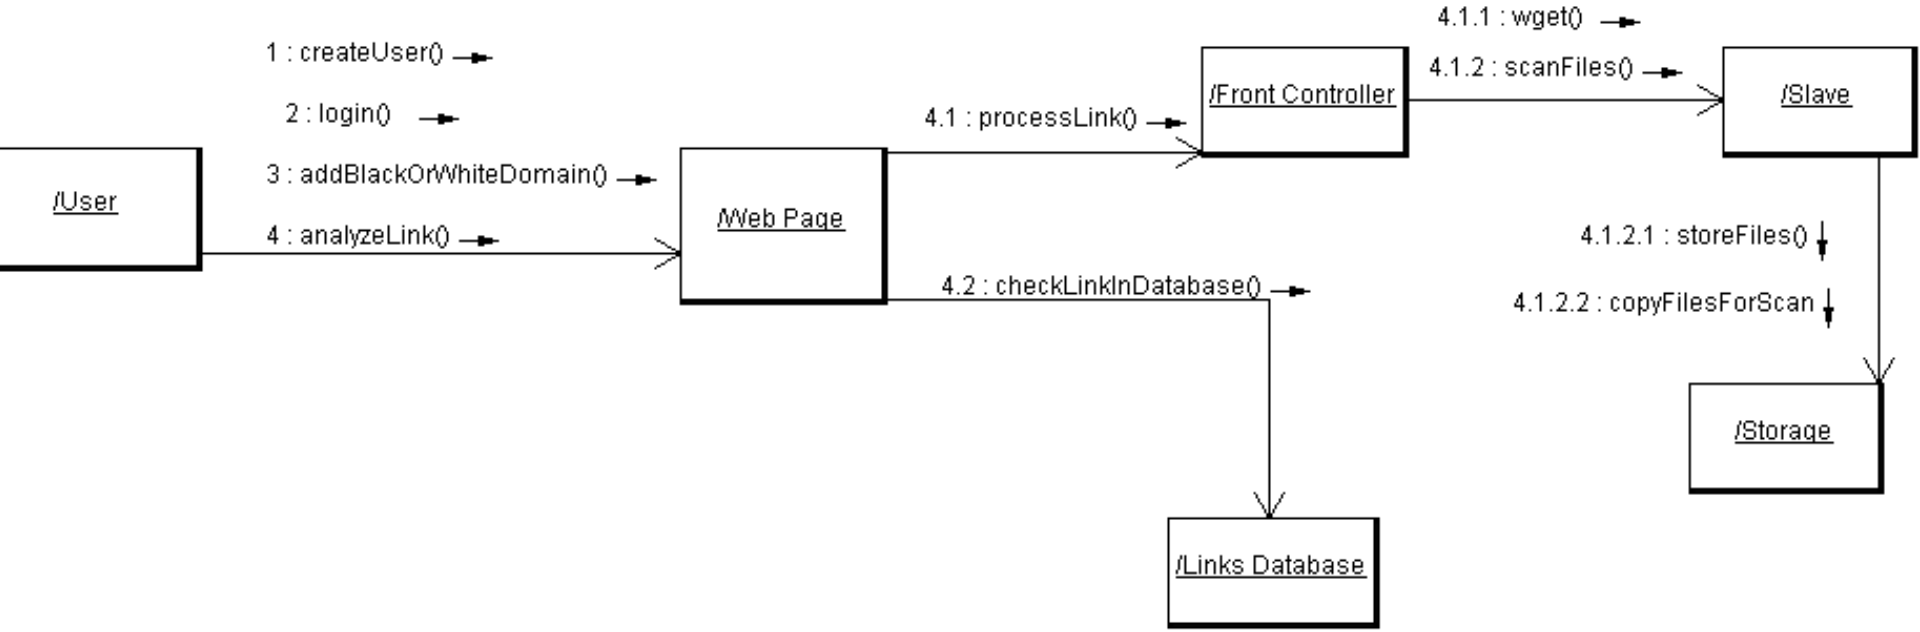
- Pune accentul pe organizarea structurală a obiectelor care participă la interacţiune
- Ilustrează mai bine ramificări complexe, iteraţii şi comportament concurent
- Poate conţine:
  - Obiecte, clase, actori
  - Legături între acestea
  - Mesaje

Exemplul 1



1: selectOption()
:User
p:WebPage
:DBMS
2: process(cmd)
5: inf=query(sqlCmd)
:ApplicationController
h:Handler
4: nextPage=handle(cmd)
7: display()
3: h=getHandler(cmd)
6: create(inf)
nextPage:WebPage
{new}

Exemplul 3



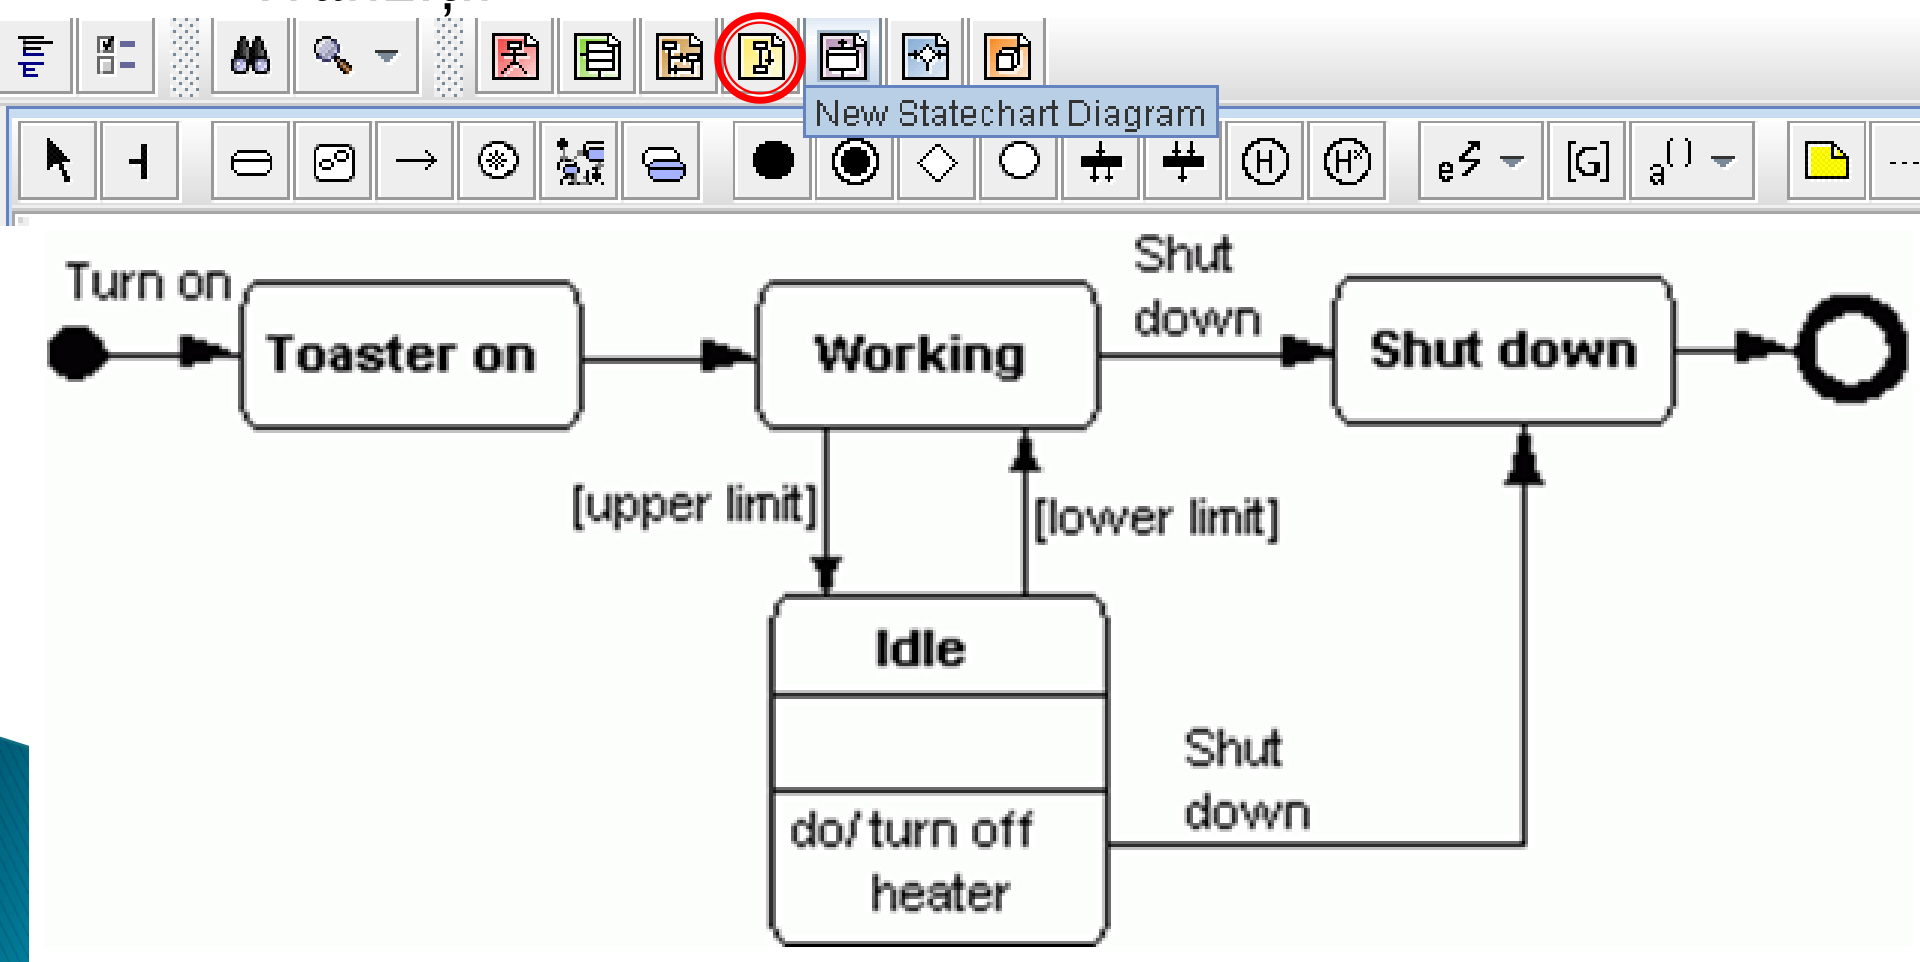
1 : createUser()
2 : login()
3 : addBlackOrWhiteDomain()
4 : analyzeLink()
/User
/Web Page
4.1 : processLink()
/Front Controller
4.1.1 : wget()
4.1.2 : scanFiles()
/Slave
4.1.2.1 : storeFiles()
4.1.2.2 : copyFilesForScan
/Storage
4.2 : checkLinkInDatabase()
/Links Database

Diagrame comportamentale

- Diagrame de stări, diagrame de activități
- Elemente de bază
  - Eveniment
  - Acțiune
  - Activitate

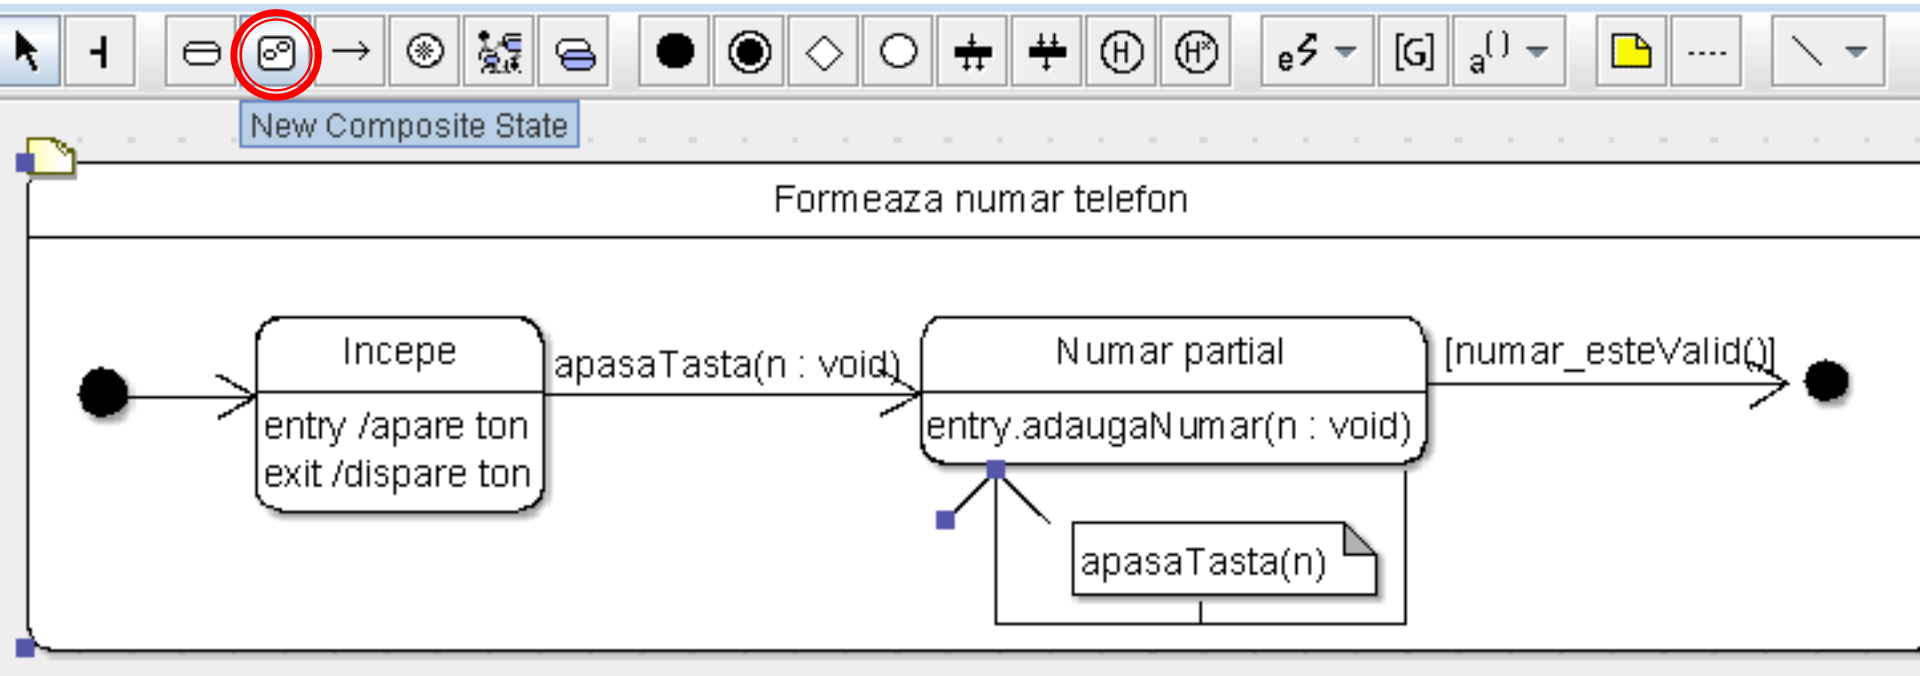
Diagramă de Stări

- Conține:
  - Stări
  - Tranziții



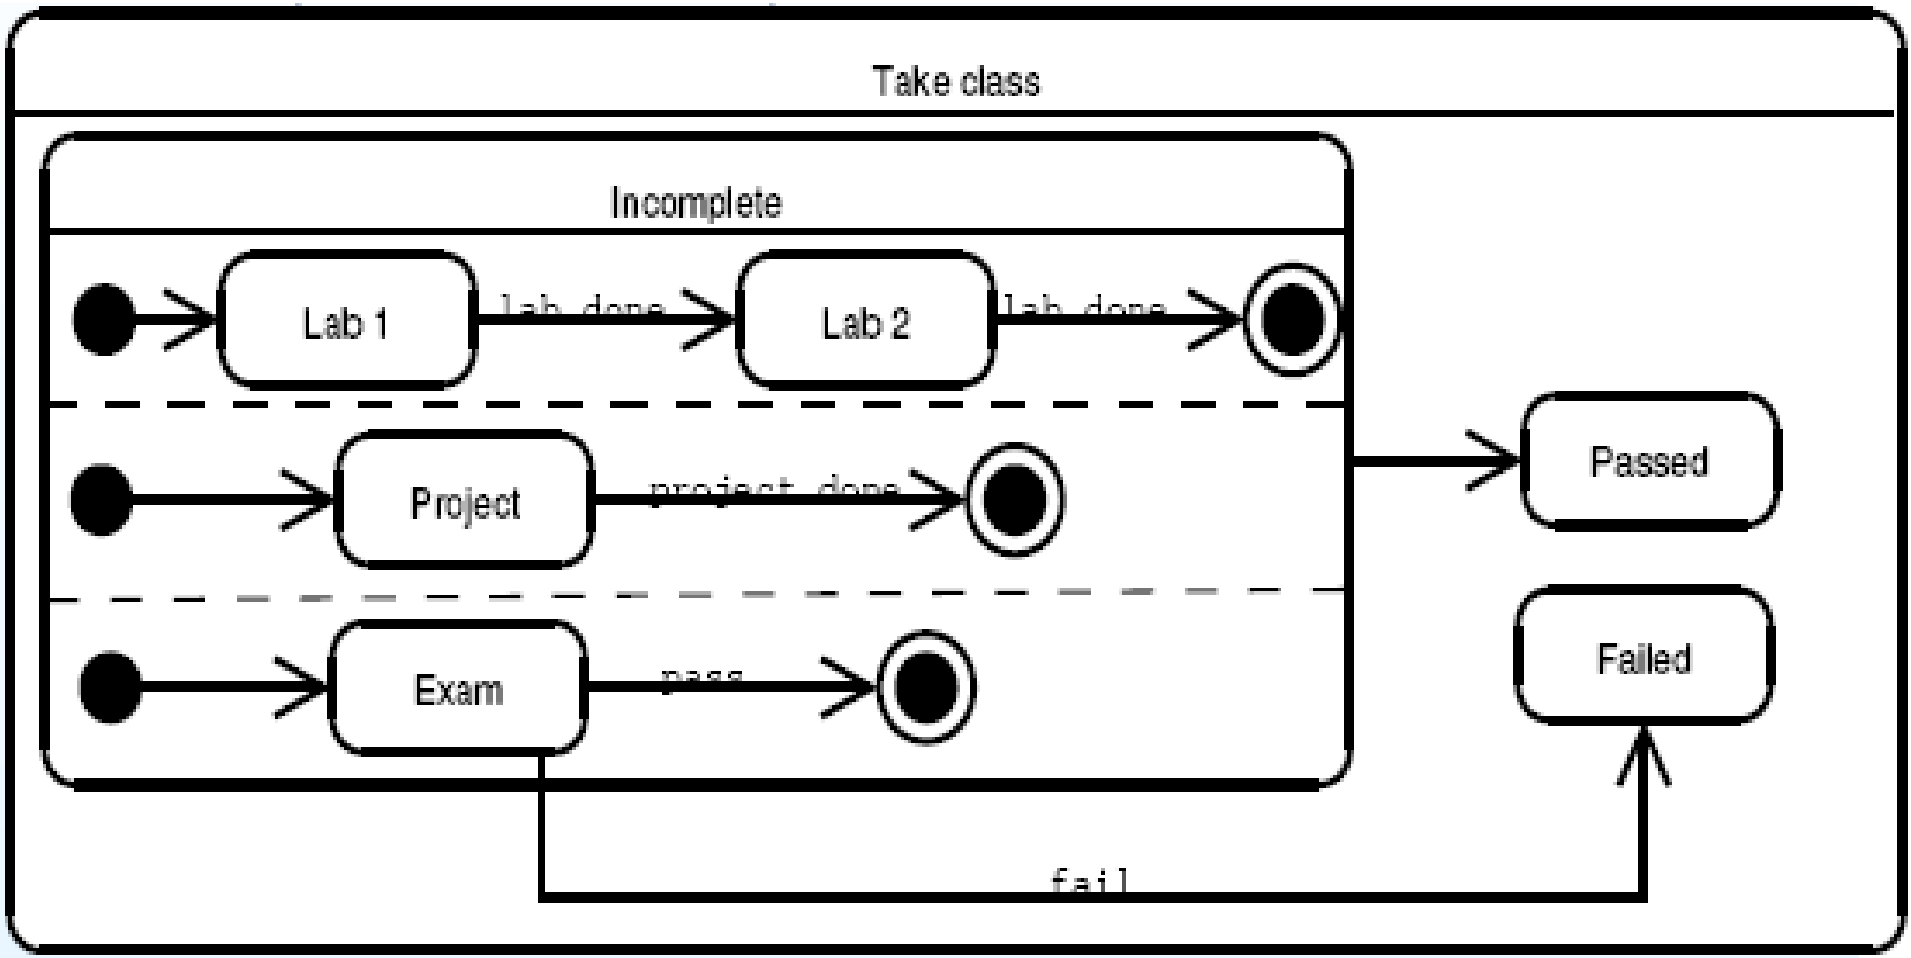
Exemplu de Stare compusă 1

- Stare compusă cu substări **secvențial** active:



Exemplu de Stare compusă 2

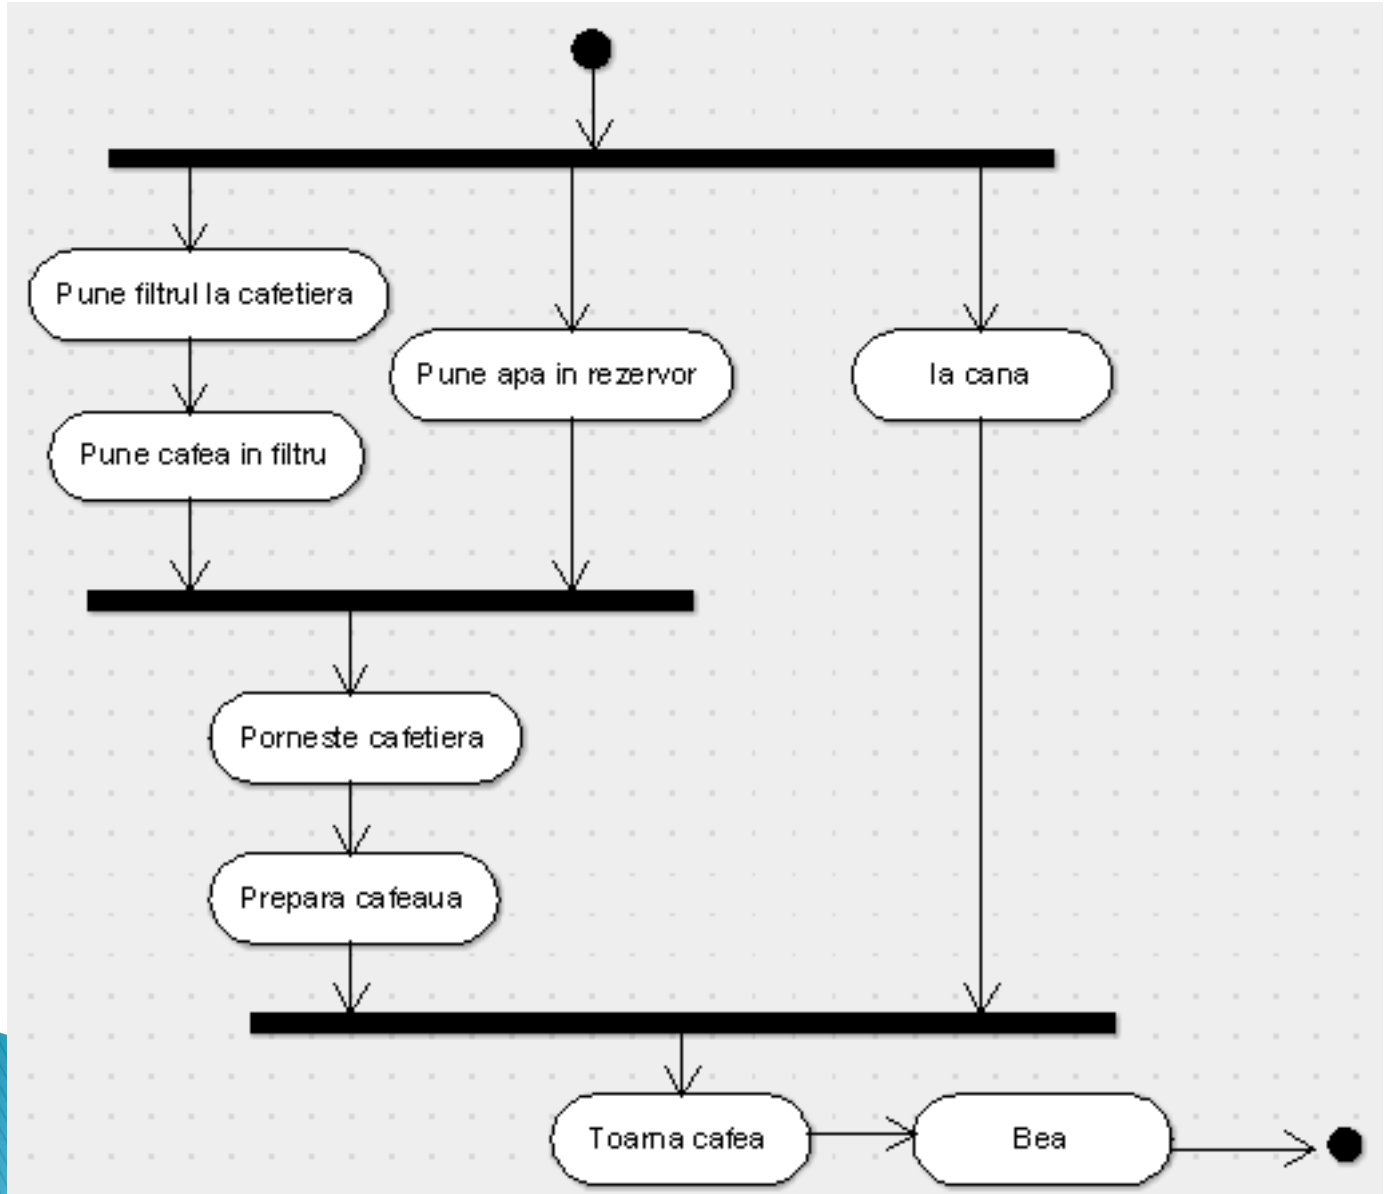
- Stare compusă cu substări **paralel** active:

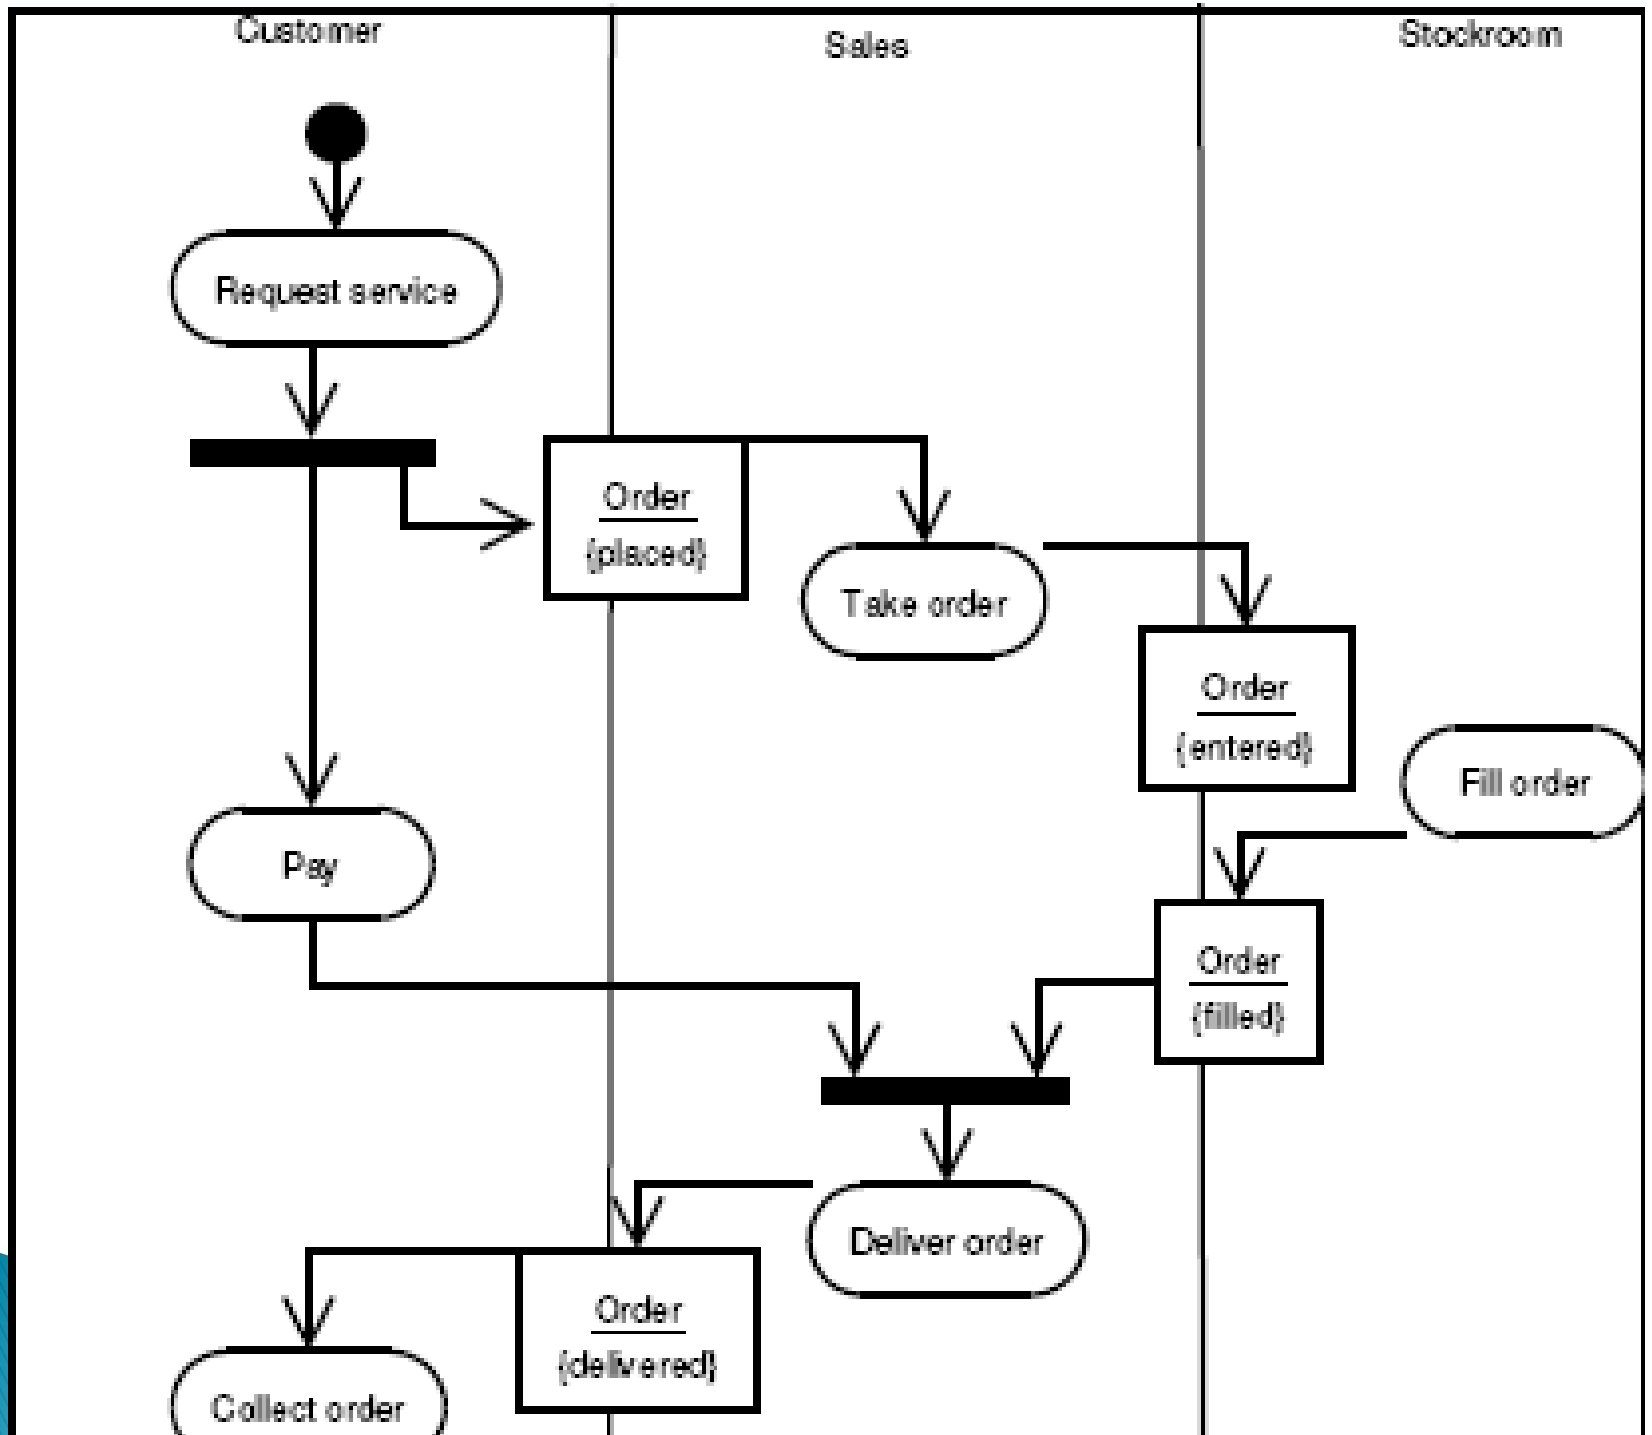


Diagramă de Activități (Activity Diagram)

- Folosită pentru **a modela dinamica unui proces sau a unei operații**
- Evidențiază controlul execuției de la o activitate la alta
- Se atașează:
  - Unei clase (modelează un caz de utilizare)
  - Unui pachet
  - Implementării unei operații

Exemplu de DA (Sincronizare)



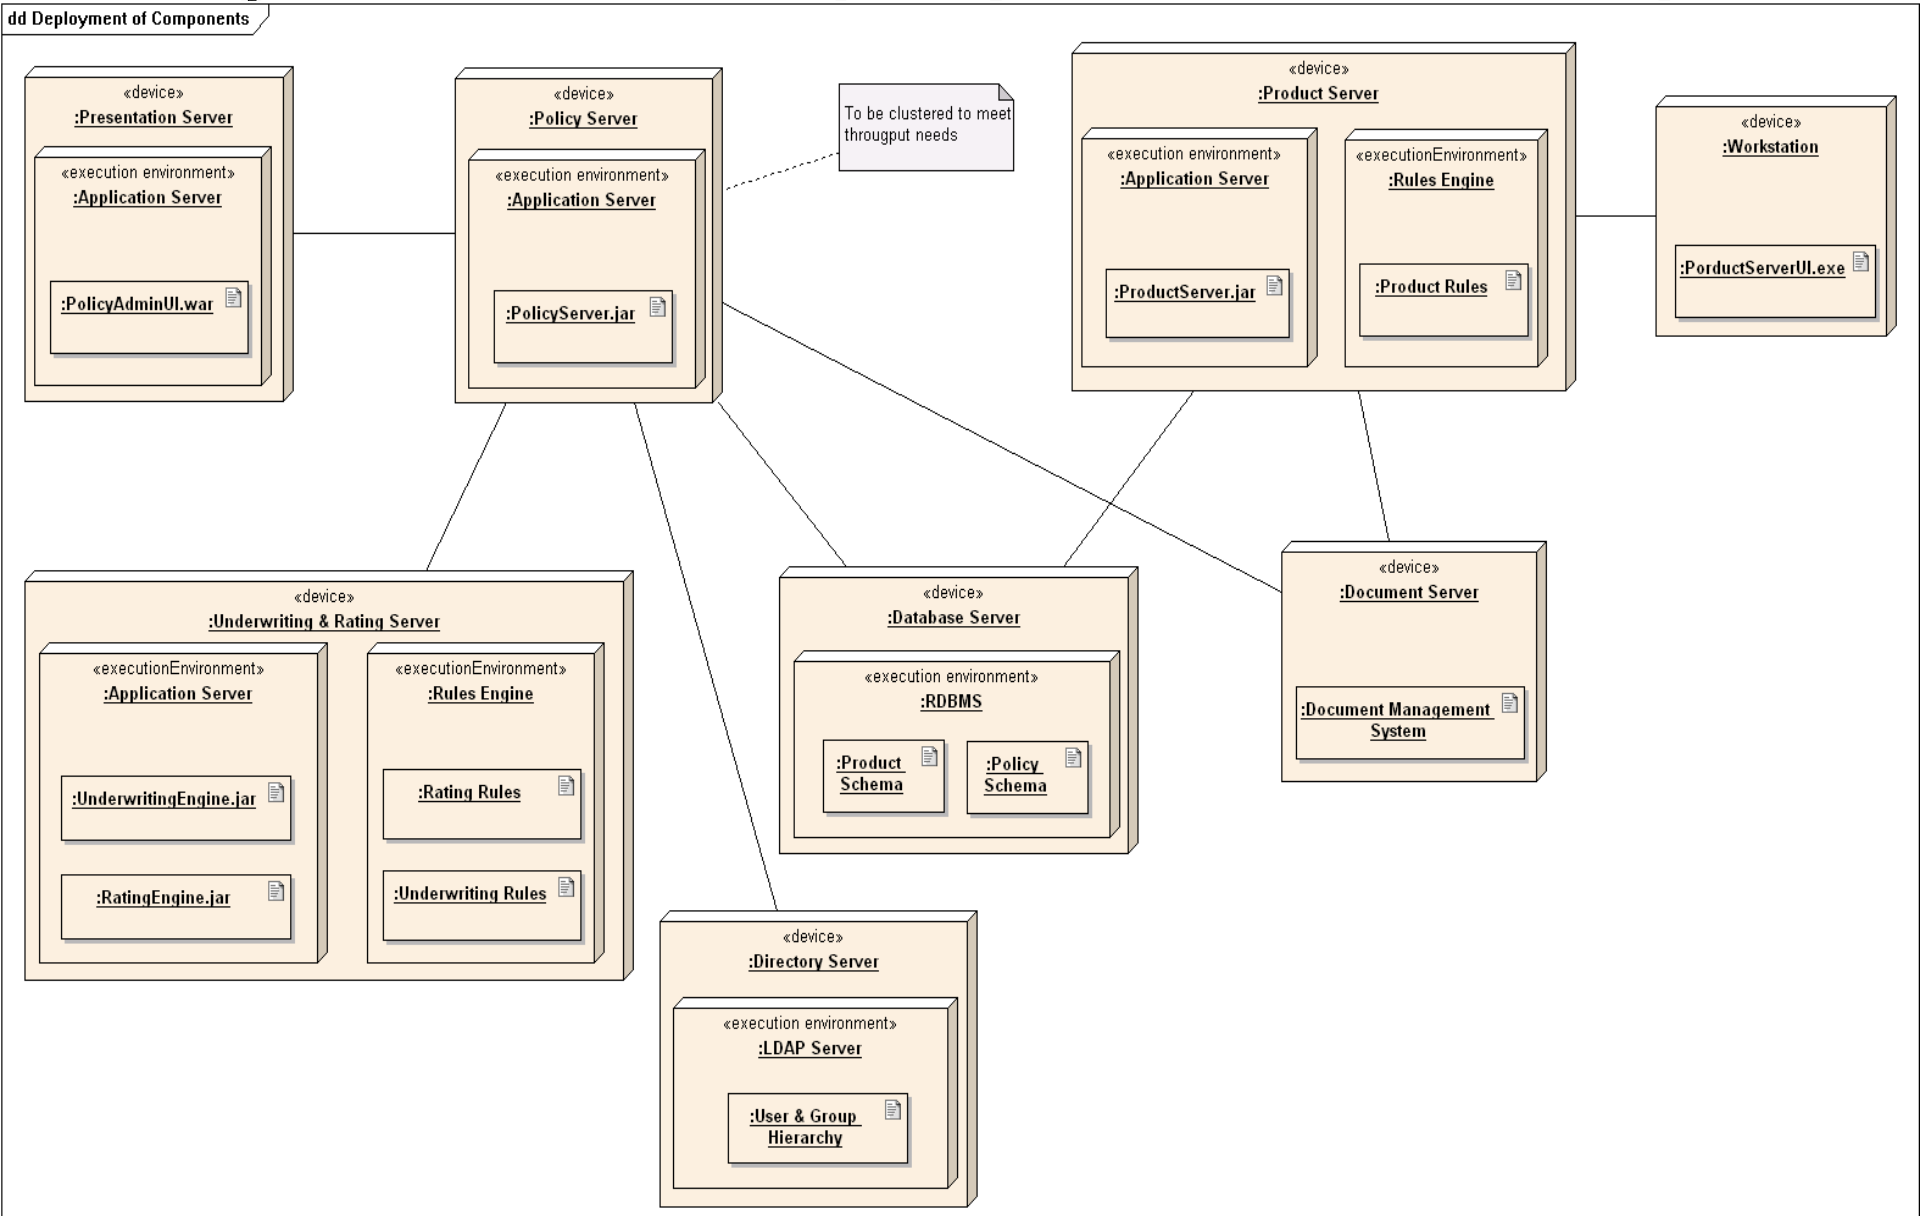


Customer
Sales
Stockroom
Request service
Order
{placed}
Take order
Order
{entered}
Fill order
Pay
Order
{filled}
Deliver order
Order
{delivered}
Collect order

Diagrame de deployment

- Modelează mediul hardware în care va funcționa proiectul
- Exemplu: pentru a descrie un site web o diagramă de deployment va conține **componentele hardware**
  - server-ul web,
  - server-ul de aplicații,
  - server-ul de baze de date
- **Componentele software** de pe fiecare din acestea
  - Aplicația web
  - Baza de date
- Modul în care acestea sunt conectate:
  - JDBC, REST, RMI

Diagramă de deployment - Exemplu 1



Diagrame de Pachete (Package Diagram)

- Pachetul:
  - Este un container logic pentru elemente între care se stabilesc legături
  - Definește un spațiu de nume
  - Toate elementele UML pot fi grupate în pachete (cel mai des pachetele sunt folosite pentru a grupa clase)
  - Un pachet poate conține subpachete => se creează o structură arborescentă (similară cu organizarea fișierele/directoarelor)

Diagrame de Pachete 2

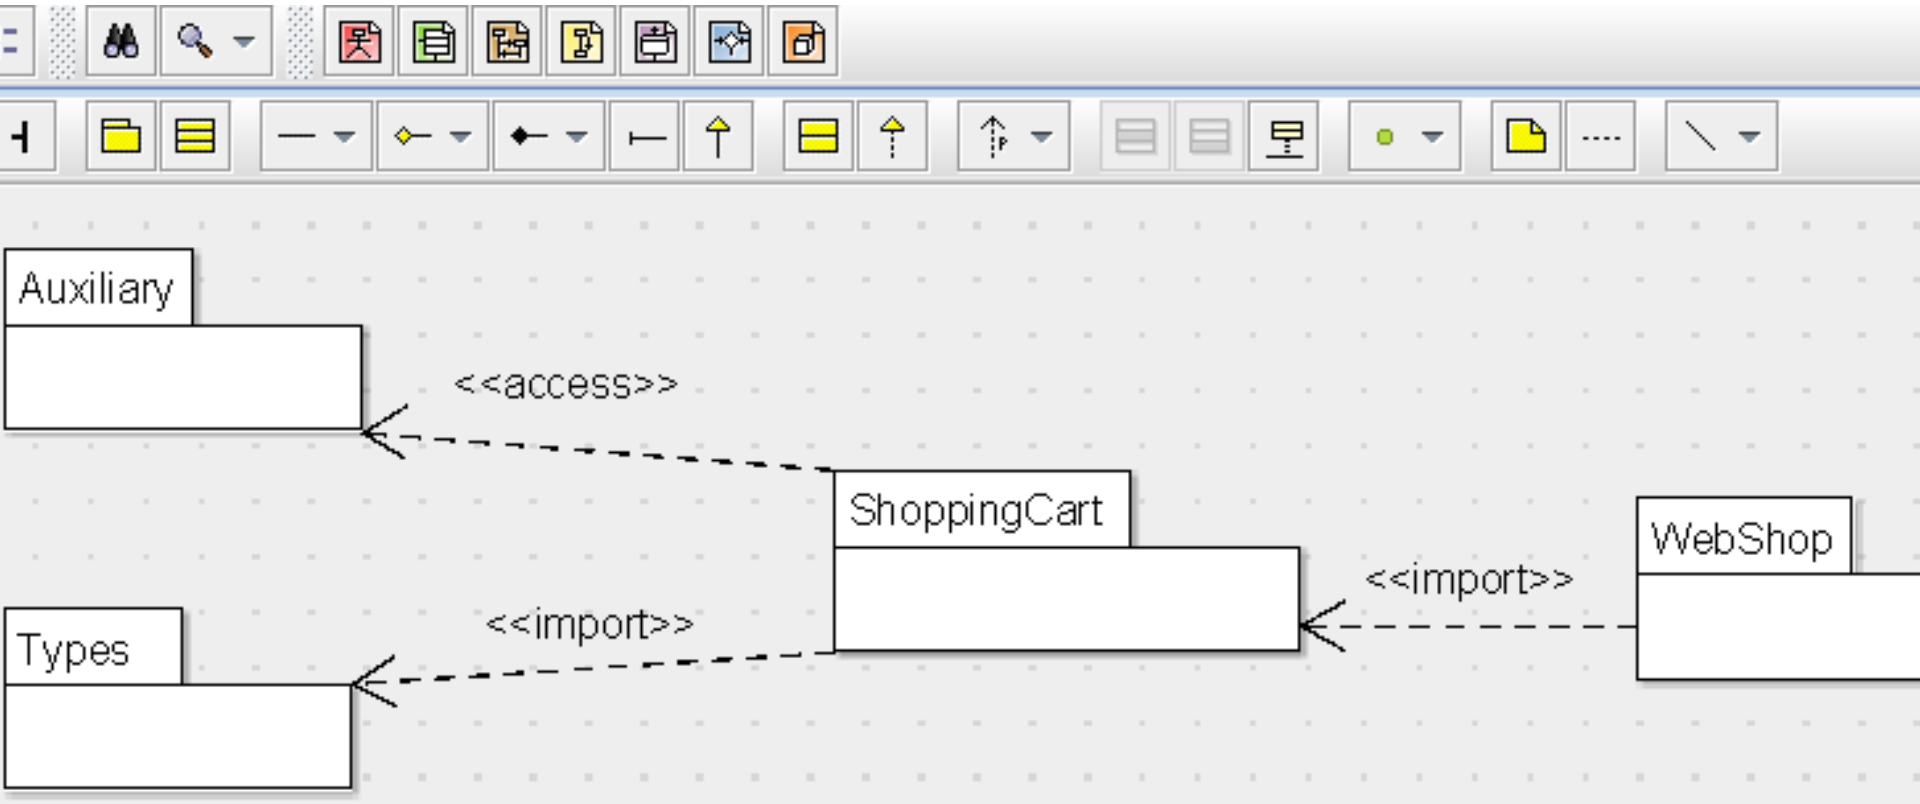
- Relații:
  - dependență <<access>> = import privat
  - dependență <<import>> = import public

- Ambele relații permit folosirea elementelor aflate în pachetul destinație de către elementele aflate în pachetul sursă fără a fi necesară calificarea numelor elementelor din pachetul destinație (similar directivei **import** din java)

- Aceste tipuri de diagrame se realizează în cadrul diagramelor de clasă

Exemplu de Diagramă de Pachete

- Elementele din Types sunt importate în ShoppingCart și apoi sunt importate mai departe de către WebShop
- Elementele din Auxiliary pot fi accesate însă doar din ShoppingCart și nu pot fi referite folosind nume necalificate din WebShop



Utilitatea diagramelor de pachete

- Împart sisteme mari în subsisteme mai mici și mai ușor de gestionat
- Permit dezvoltare paralelă iterativă
- Definirea unor interfețe clare între pachete promovează refolosirea codului (ex. pachet care oferă funcții grafice, pachet care oferă posibilitatea conectării la BD, etc...)

Recomandări în realizarea diagramelor UML

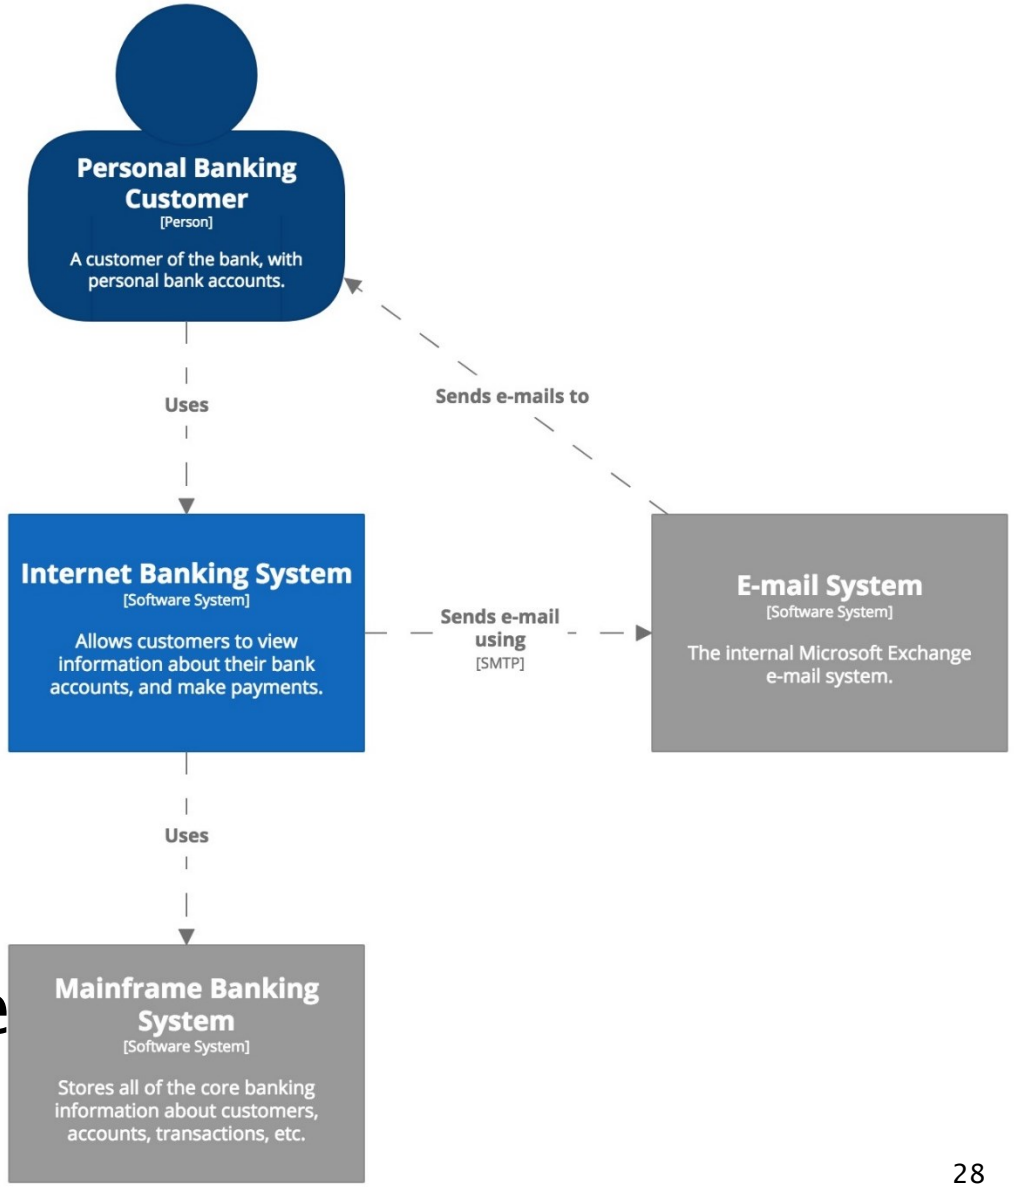
- Diagramele să nu fie nici prea complicate, dar nici prea simple: scopul este comunicarea eficientă
- Dați nume sugestive elementelor componente
- Aranjați elementele astfel încât liniile să nu se intersecteze
- Încercați să nu arătați prea multe tipuri de relații odată (evitați diagramele foarte complicate)
- Dacă este nevoie, realizați mai multe diagrame de același tip

The C4 Model for Software Architecture

- **Context, Containers, Components** and **Code**
- **Provides different levels of abstraction**, each of which is relevant to a different audience
- Avoid ambiguity in your diagrams by **including a sufficient amount of text** as well as a key/legend for the notation you use

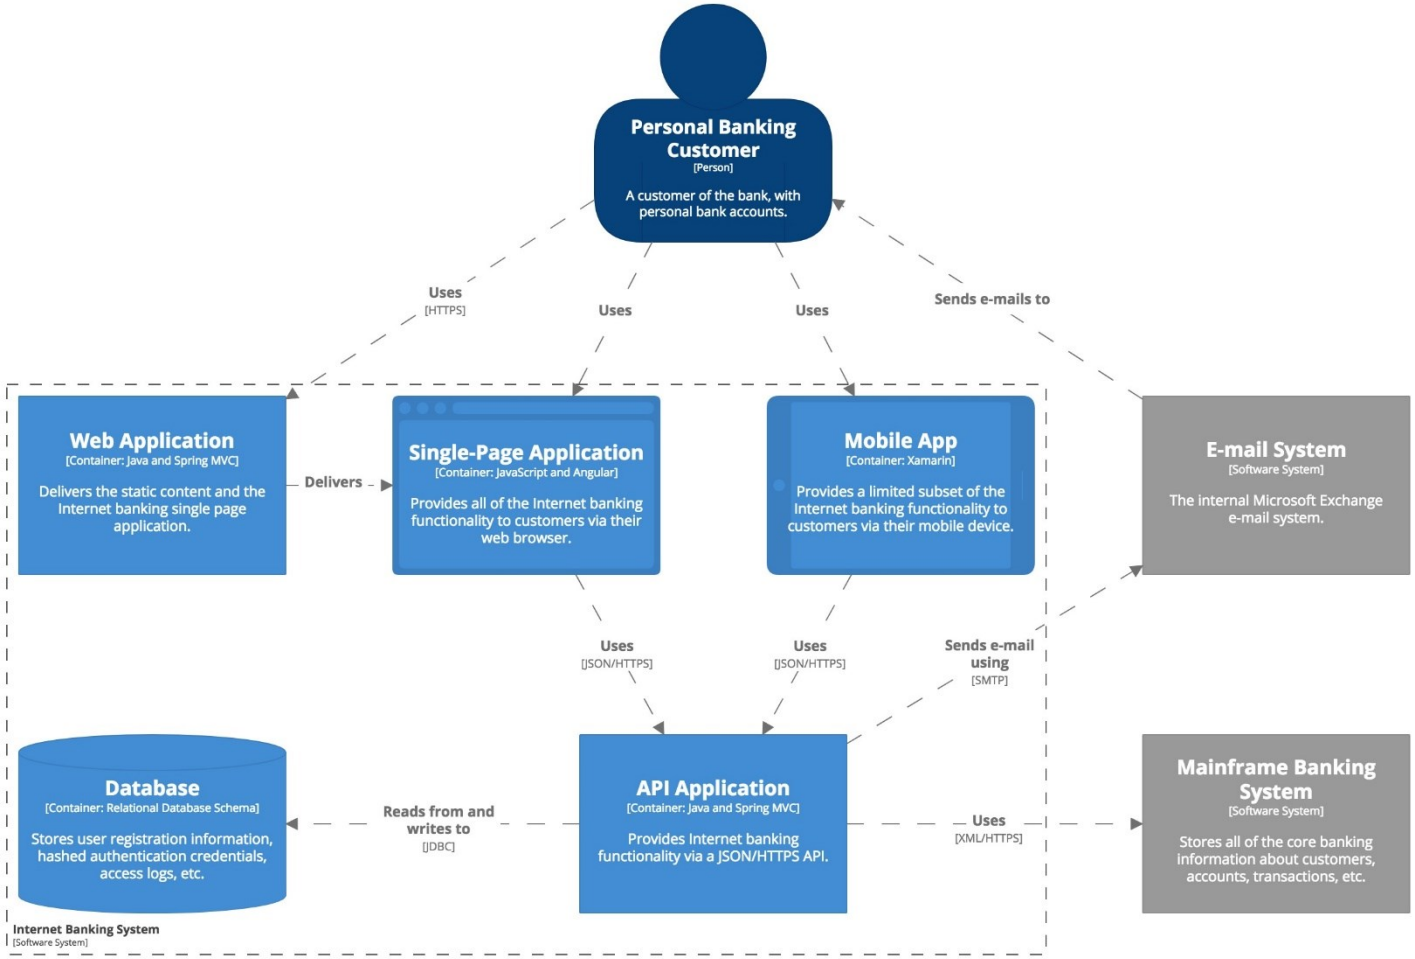
C4 Model – Level 1: System context diagram

- Shows the software system you are building
- How it fits into the world in terms of the people who use it and the other software systems it interacts with
- Colours – Systems already exist (the **grey** boxes) and those to be built (**blue**)



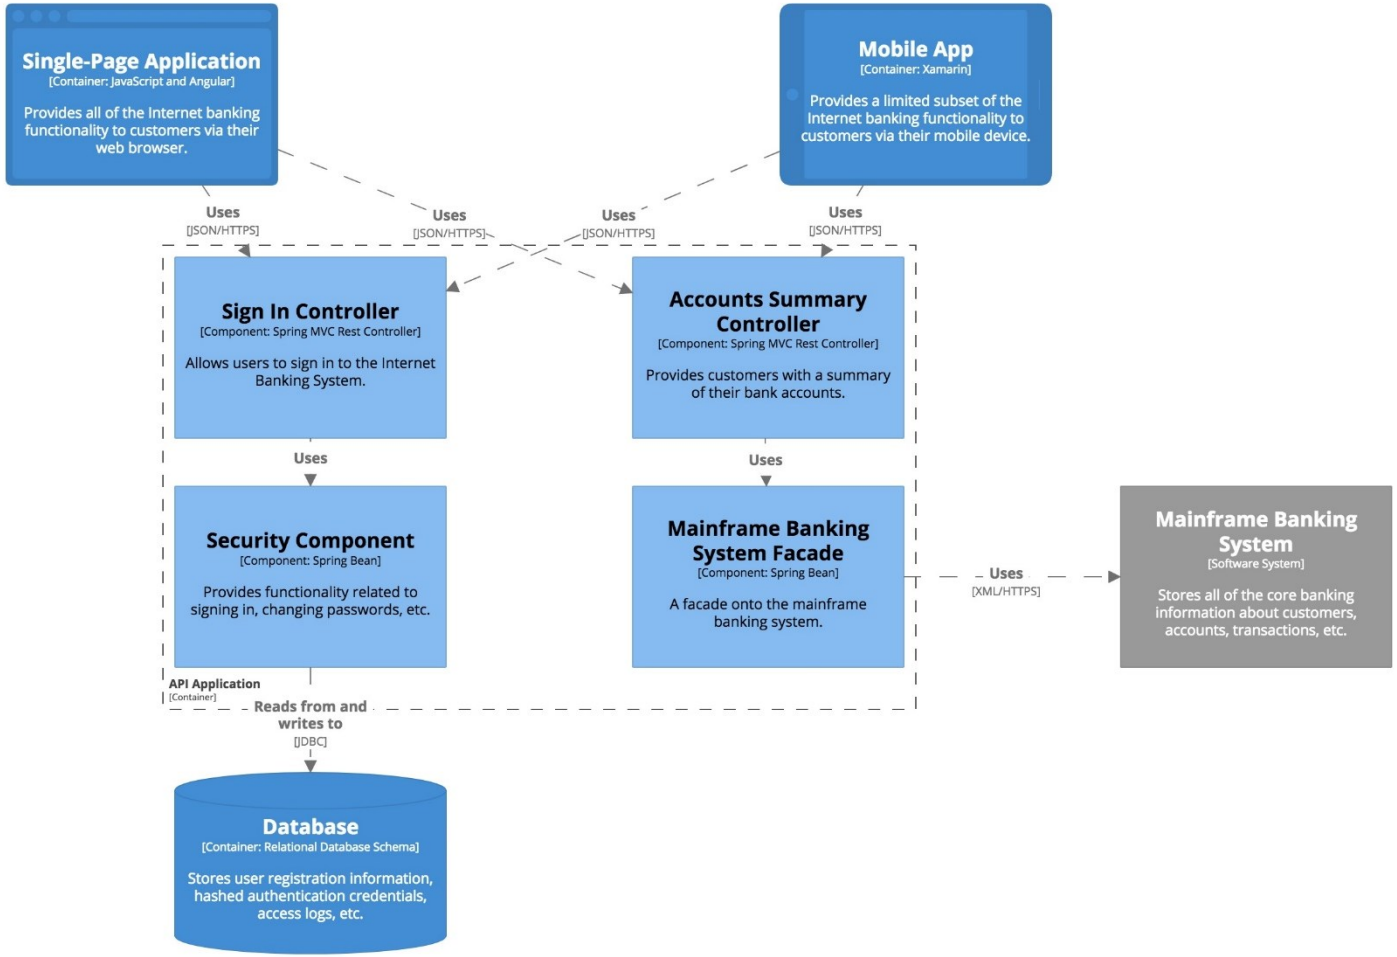
C4 Model – Level 2: Container diagram

- Zooms into the software system, and shows the containers (applications, data stores, microservices, etc.)



C4 Model – Level 3: Component diagram

- Zooms into an individual container to show the components inside it



C4 Model – Level 4: Code

- Zoom into an individual component to show how that component is implemented

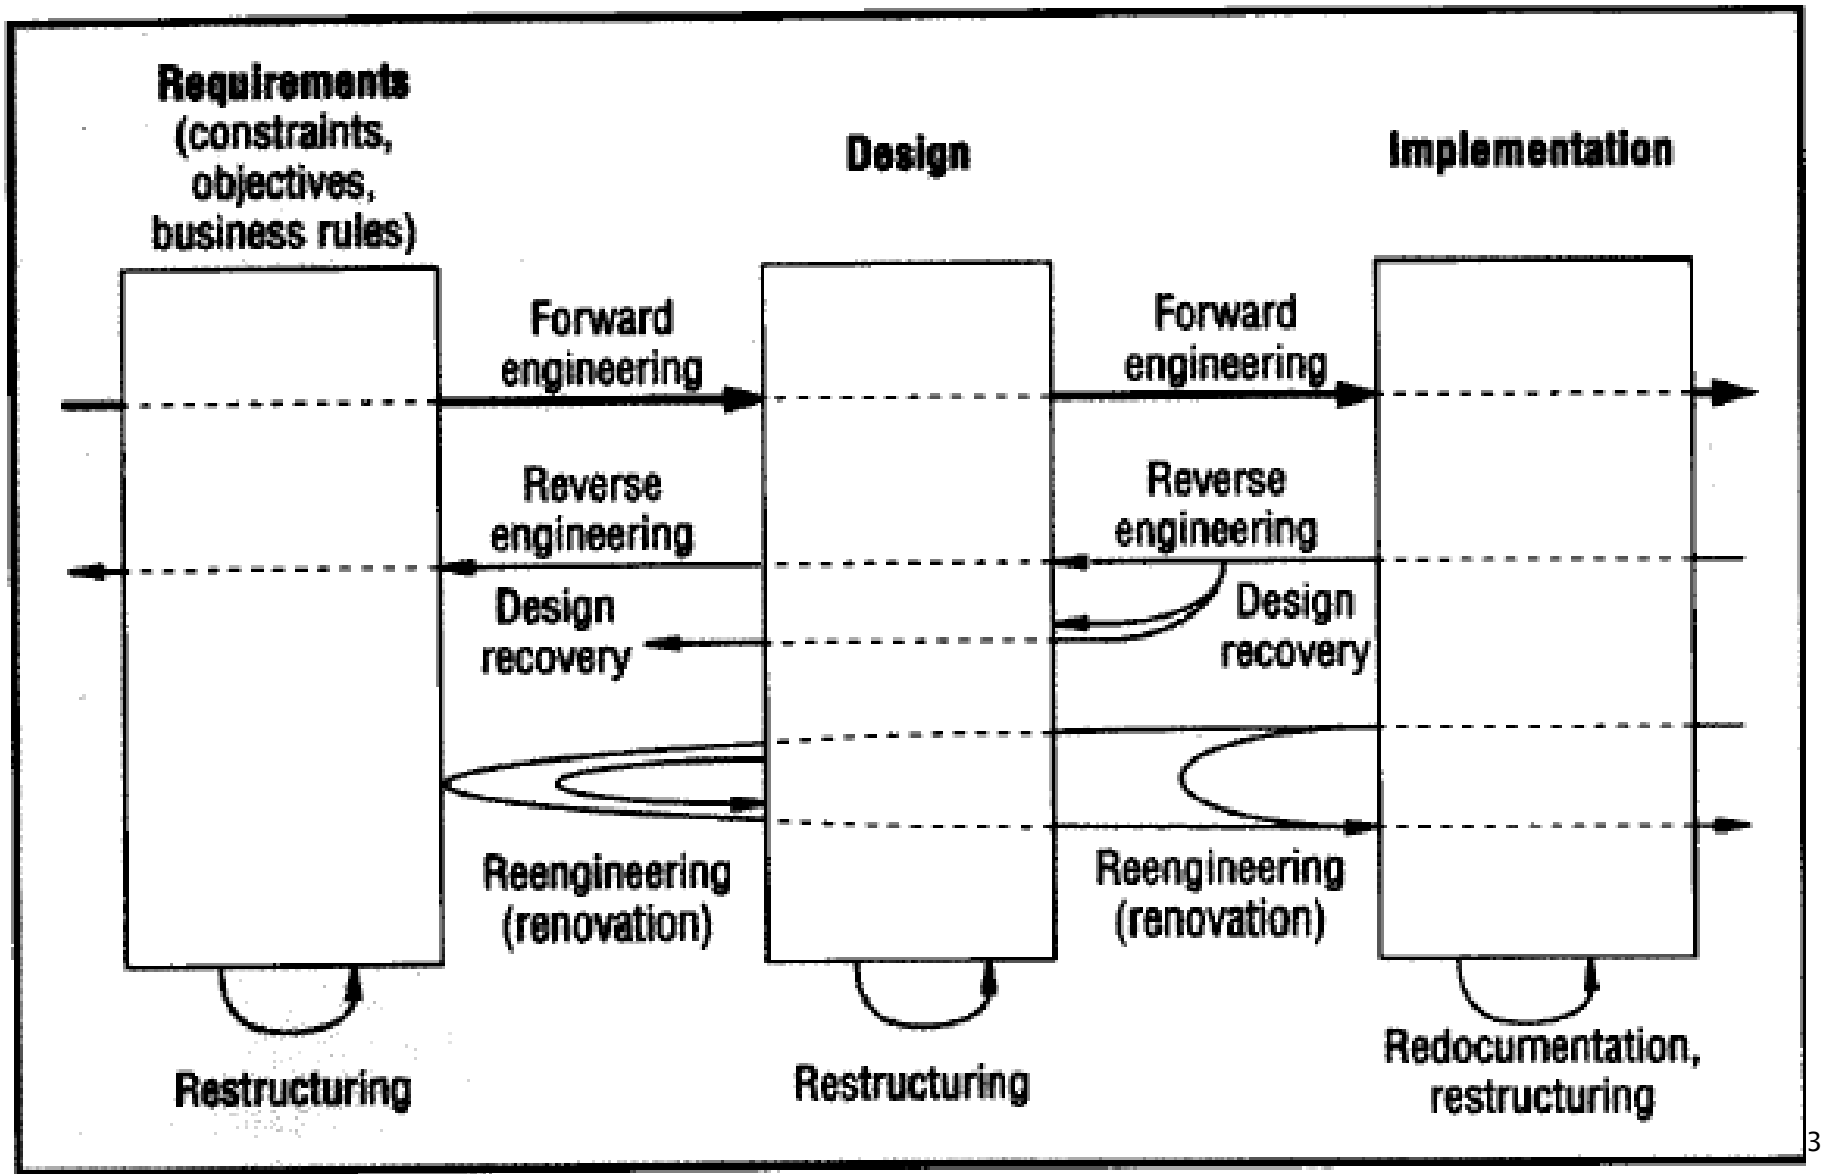
Forward and Reverse Engineering



Forward Engineering

- A traditional process of moving from high-level abstractions and logical to the implementation-independent designs to the physical implementation of a system

- FE follows a sequence of going **from requirements through designing its implementation**

Reverse Engineering

- **Reverse engineering** (RE) is the process of discovering the technological principles of a device, object or system through analysis of its structure, function and operation
- *To try to make a new device or program that does the same thing without copying anything from the original*
- Reverse engineering has its origins in the analysis of hardware for commercial or military advantage

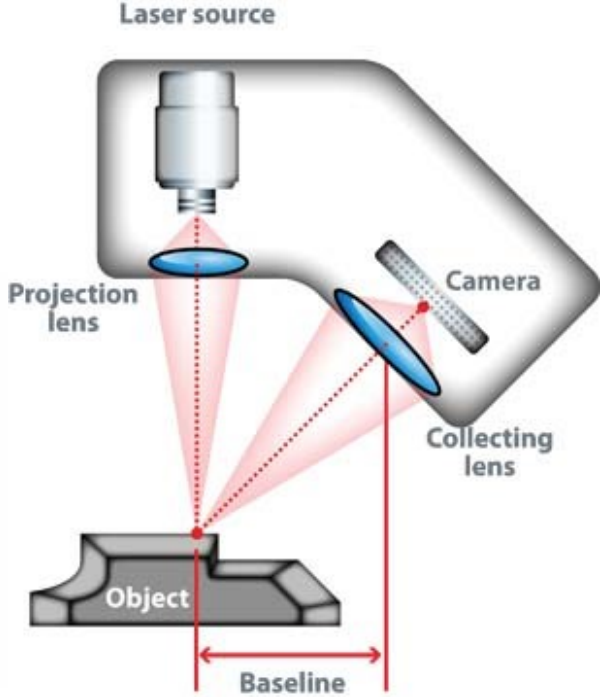
RE Motivation

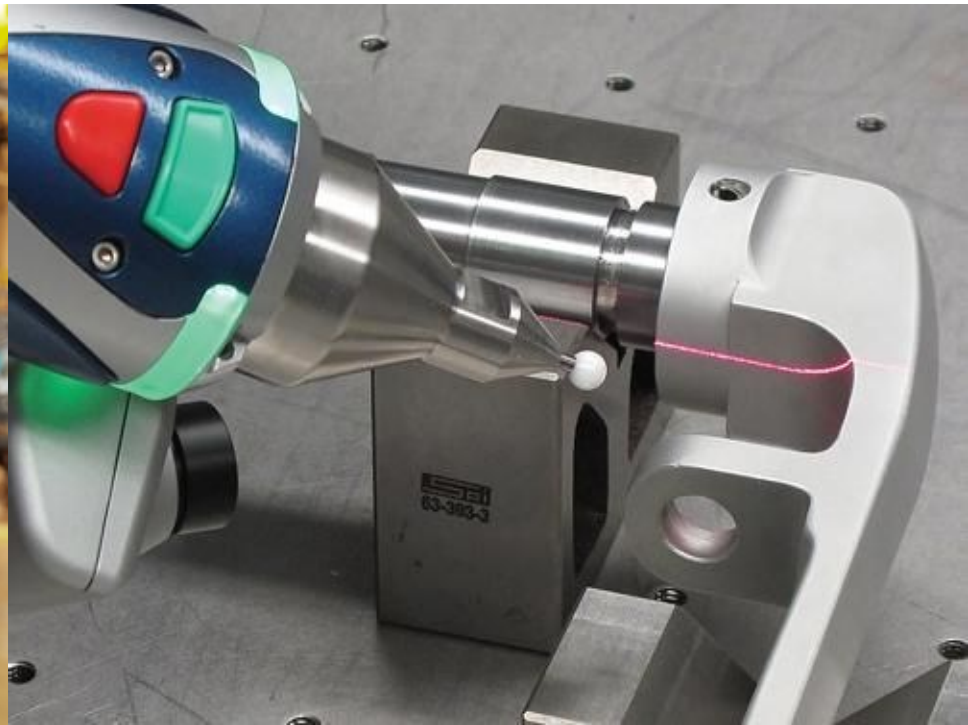
- Interoperability
- Lost documentation
- Product analysis
- Security auditing
- Removal of copy protection, circumvention of access restrictions
- Creation of unlicensed/unapproved duplicates
- Academic/learning purposes
- Curiosity
- Competitive technical intelligence (understand what your competitor is actually doing versus what they say they are doing)
- Learning: Learn from others mistakes

Types of RE

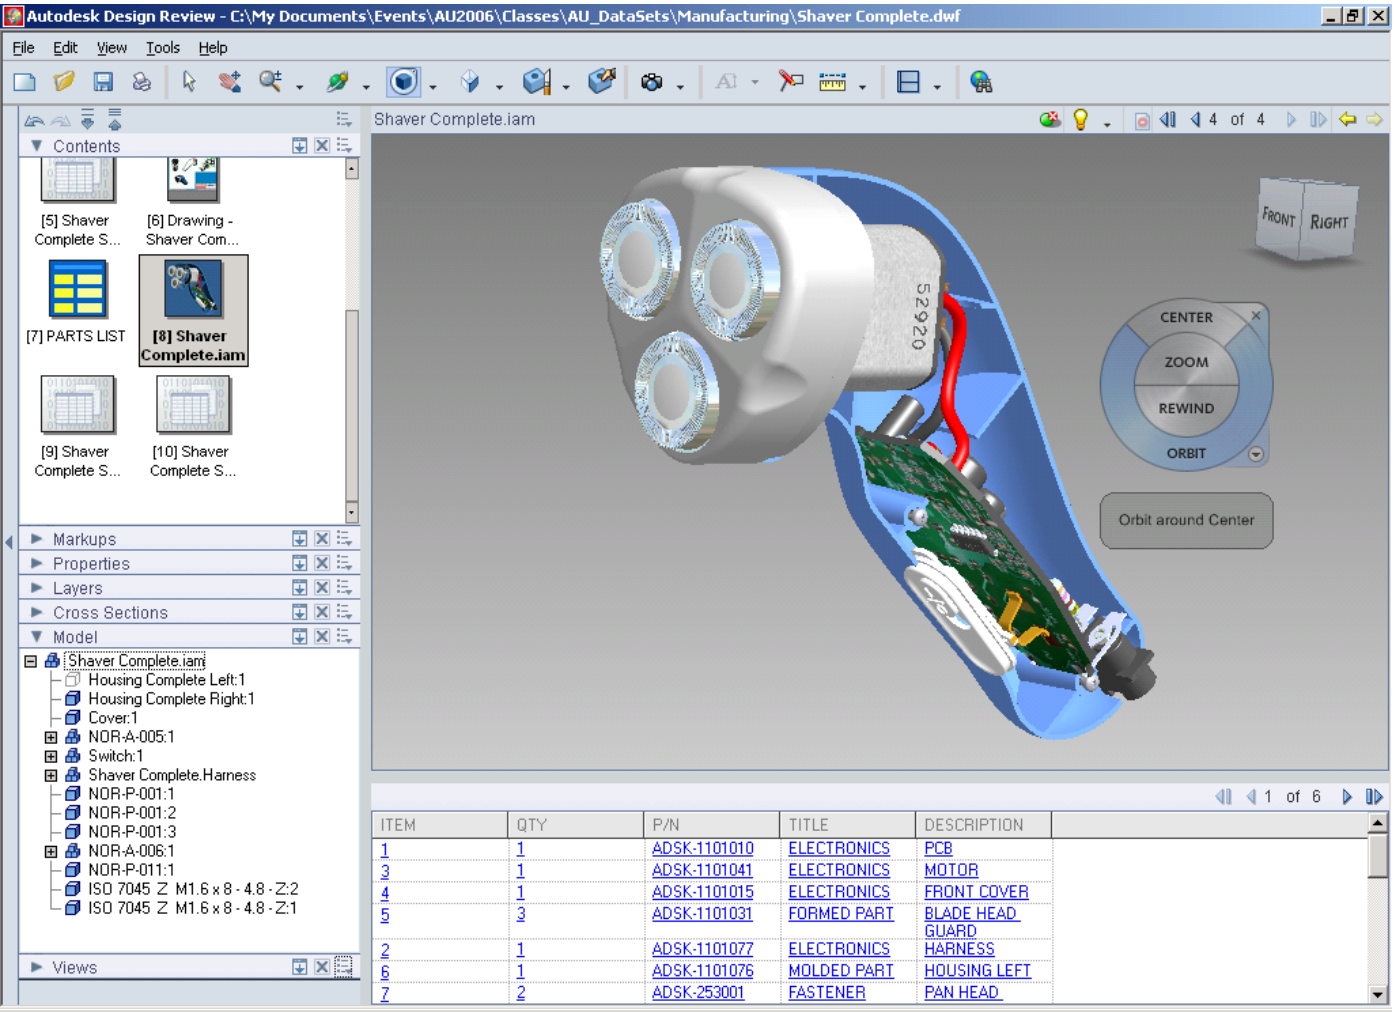
- RE1: Reverse engineering of mechanical devices
- RE2: Reverse engineering of integrated circuits/smart cards
- RE3: Reverse engineering for military applications
- RE4: Reverse engineering of software

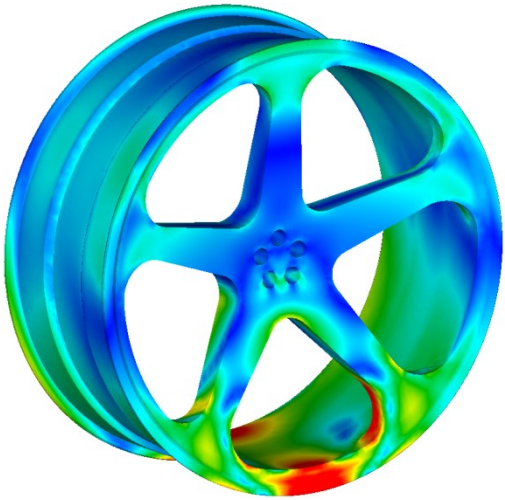
RE1: Scanere laser 3D

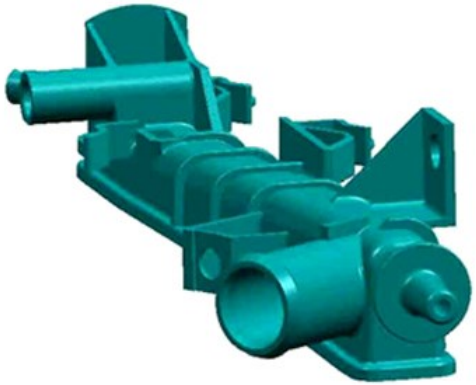




RE1: Servicii de modelare 3D CAD





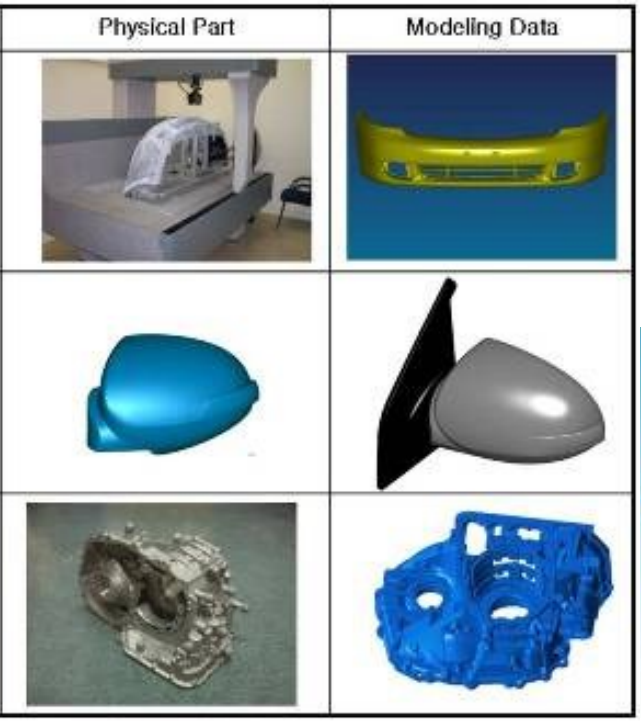


RE1: Servicii de imprimare 3D

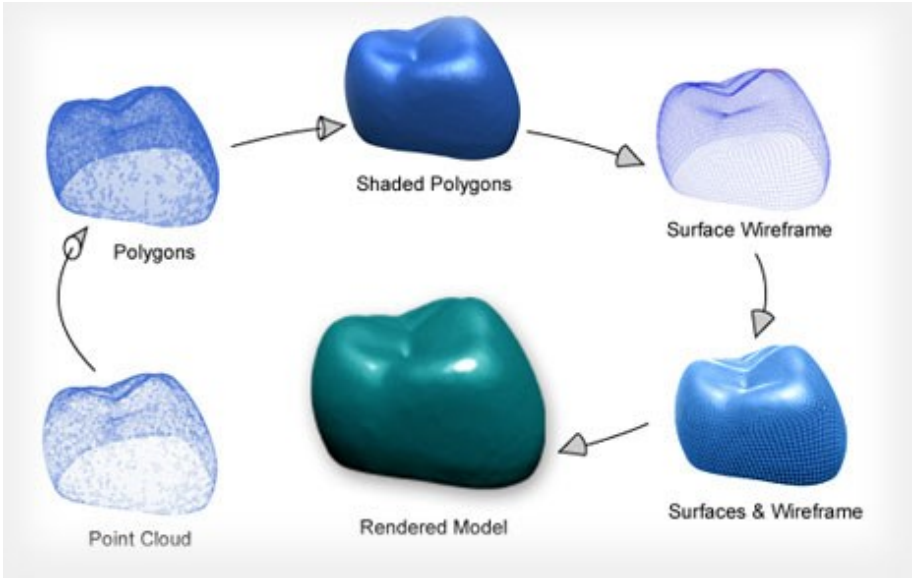
- Rapid prototyping

- FullCure materials

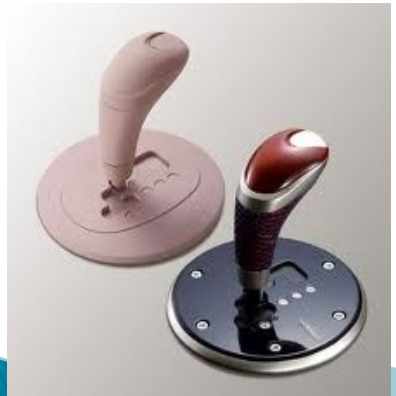
RE1: Domenii

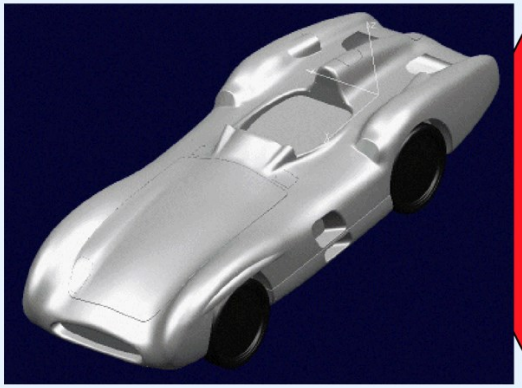


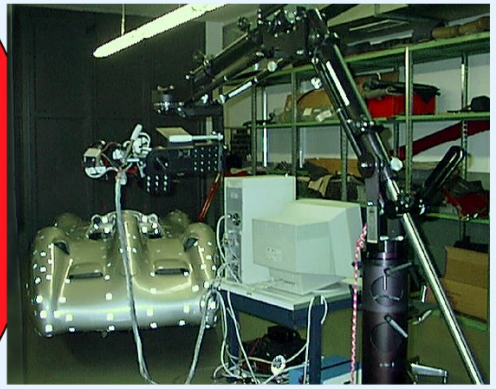
Physical Part
Modeling Data

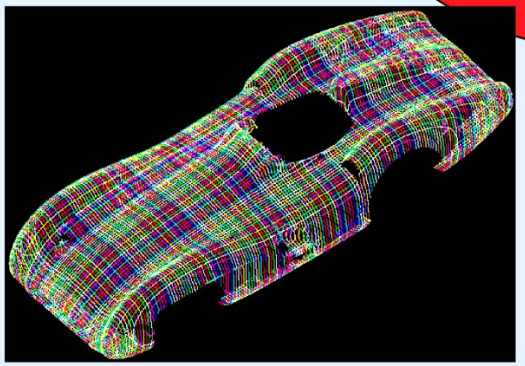


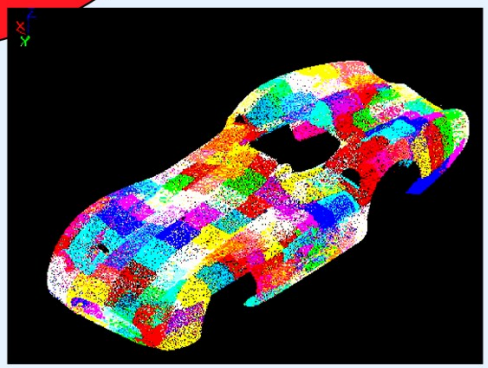
Shaded Polygons
Polygons
Surface Wireframe
Point Cloud
Rendered Model
Surfaces & Wireframe











Reverse engineering of integrated circuits/smart cards

- RE is an invasive and destructive form of analyzing a smart card
- The attacker grinds away layer by layer of the smart card and takes pictures with an electron microscope
- Engineers employ sensors to detect and prevent this attack

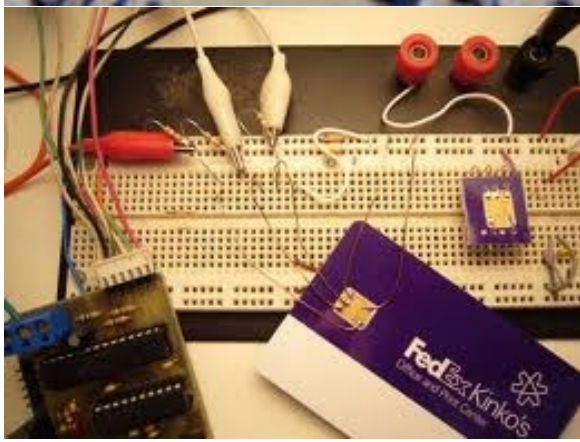
RE2: Smart cards

- Satellite TV
- Security card
- Phone card
- Ticket card
- Bank card



Reverse engineering for military applications

- Reverse engineering is often used by militaries in order to copy other nations' technologies, devices or information that have been obtained by regular troops in the fields or by intelligence operations

- It was often used during the Second World War and the Cold War

- Well-known examples from WWII and later include: rocket, missile, bombers, China has reversed many examples of US and Russian hardware, from fighter aircraft to missiles and HMMWV cars

RE3: Avioane

- US – B-29

URSS – Tupolev Tu-4

Reverse Engineering a UFO
by Robert Klein

Reverse engineering of software

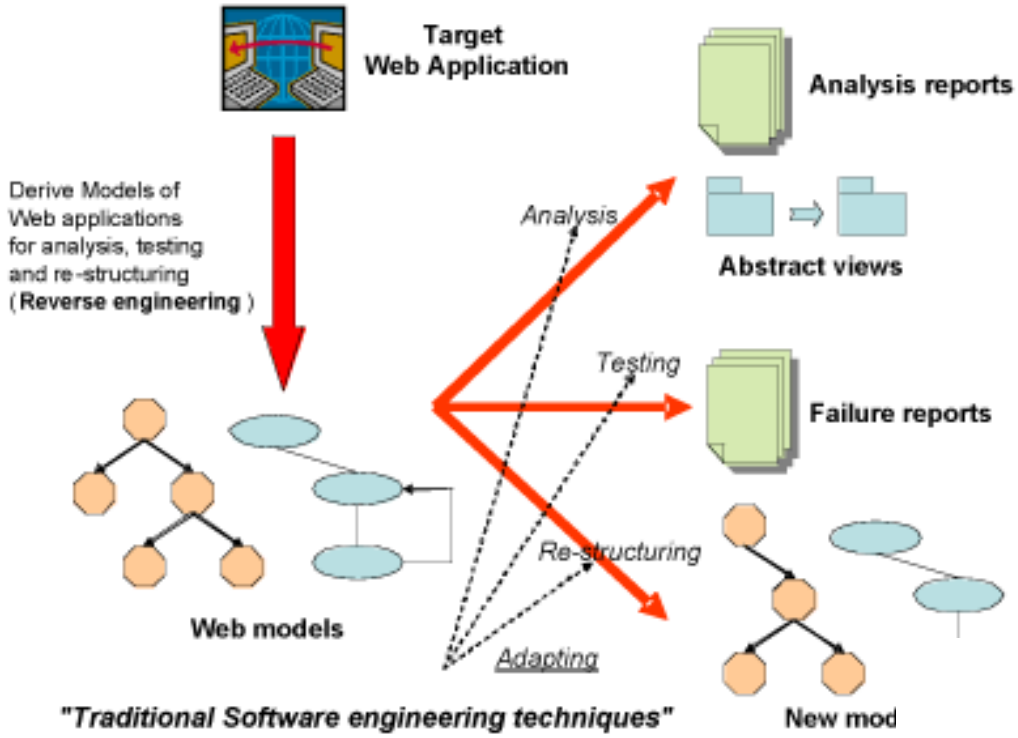
- Reverse engineering is the process of analyzing a subject system to create representations of the system at a higher level of abstraction

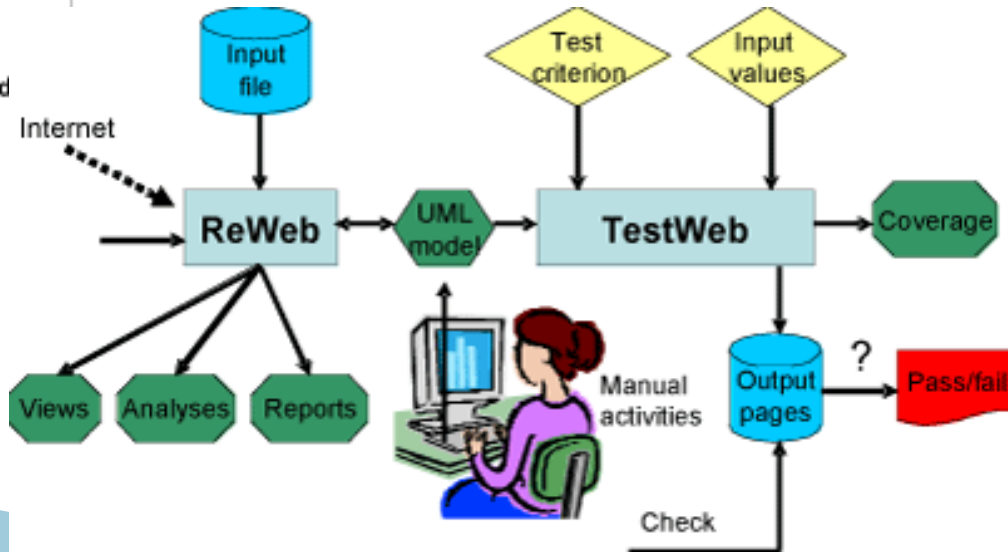
- In practice, two main types of RE emerge:
  - **Source code is available** (but it is poorly documented)
  - **There is no source code available for the software**

- **Black box testing** in software engineering has a lot in common with reverse engineering

RE4: Smart phones

RE4 of Web Applications





RE4: DJ Java Decompiler 3.10.10.93

```
public class Test
{
   private int n;
   private int m;

   public static void main(String
   args[])
   {
        for(int i=1;i<10;i++)
        System.out.println("Test");
   }
}
```

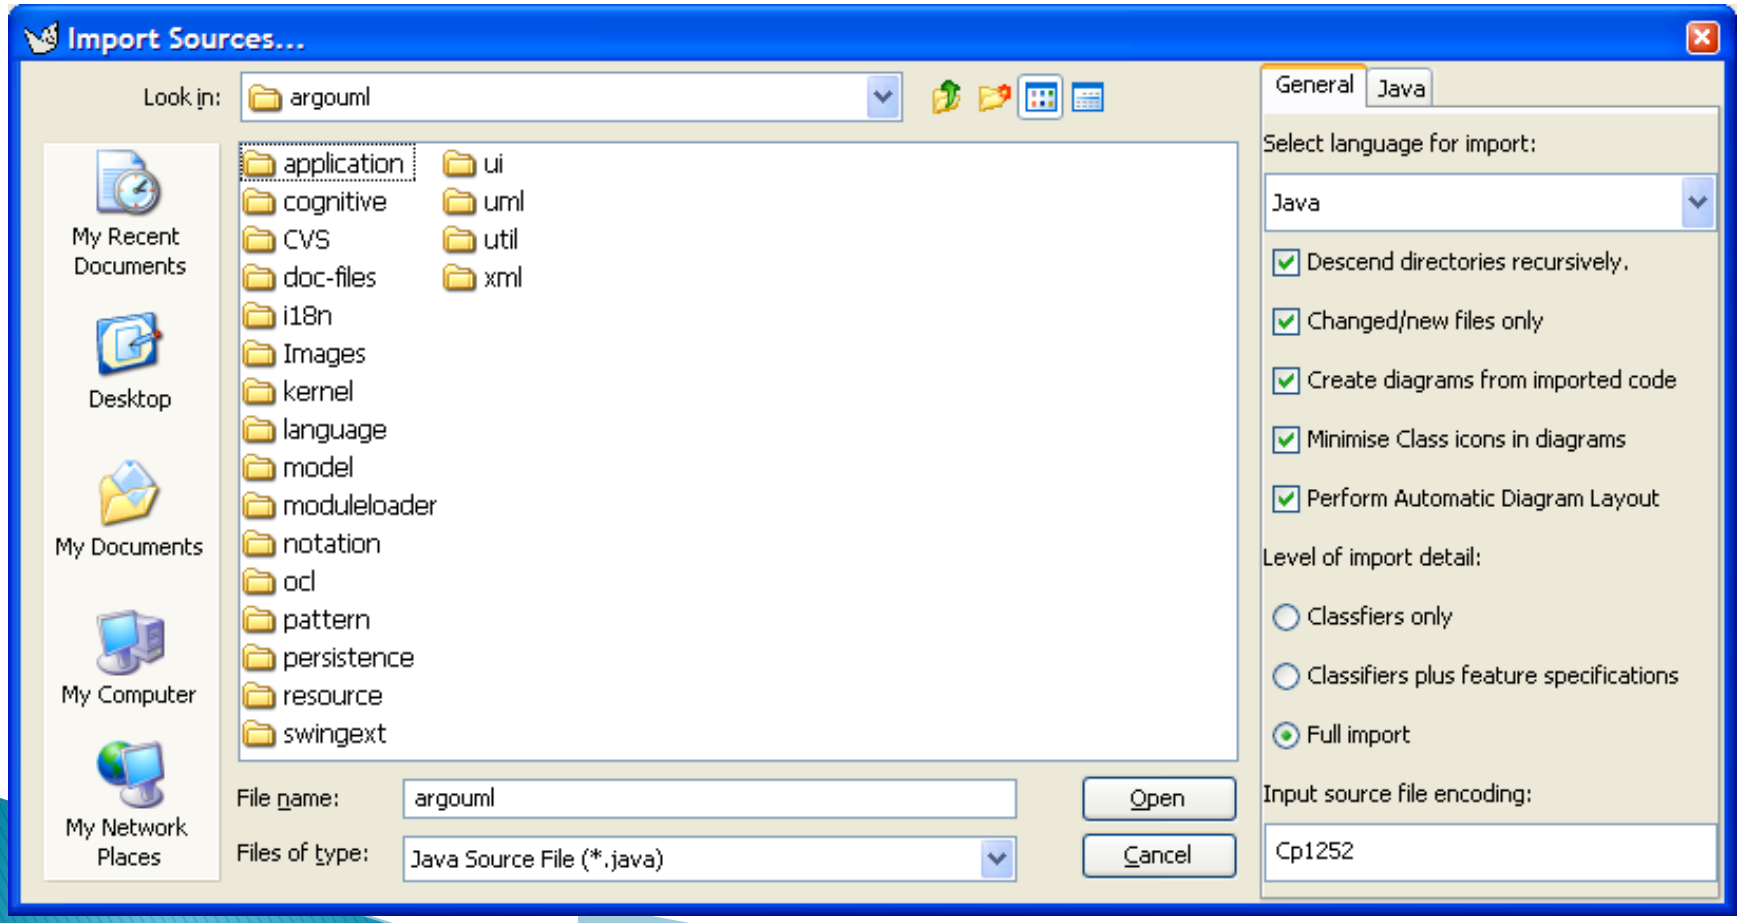
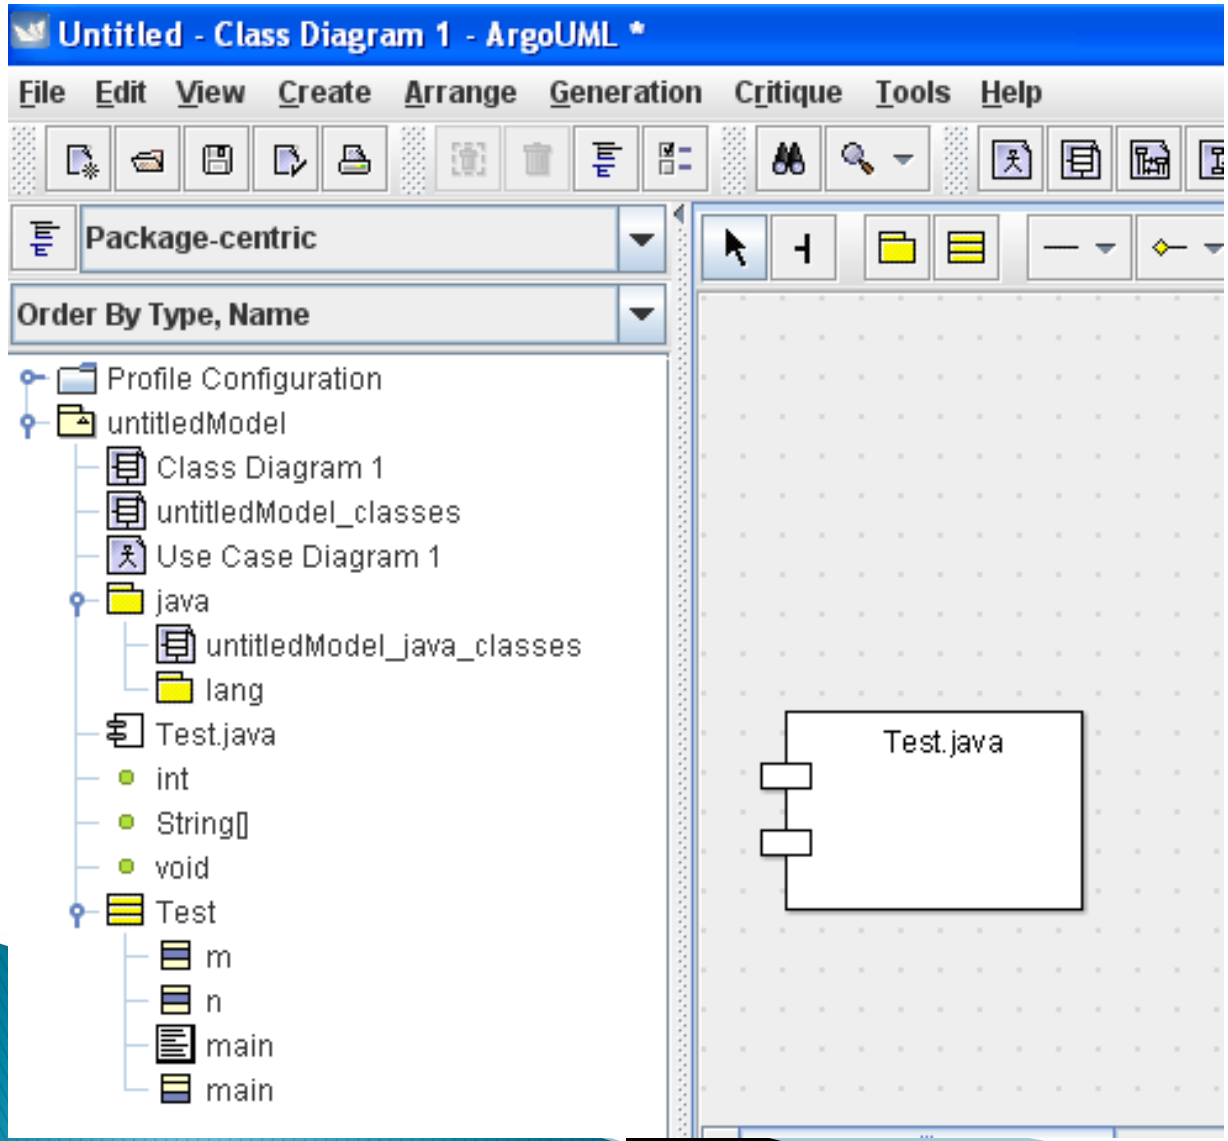
RE în ArgoUML

- File -> **Import Sources...**



Pentru exemplul anterior...



Demo FE & RE

- Forward engineering:
  - Diagrame de clasă -> .java files (ArgoUML)
  - .java files -> .class files (NetBeans)

- Reverse engineering:
  - .class files -> .java files (JAD Decompiler)
  - .java files -> Diagrame de Clasă (ArgoUML)

Concluzii

- Diagrame UML:
  - Interacțiuni
  - Comportamentale
  - Structură

- C4 Model: context, container, component, code
